Facilitator guide — Visualizations & Interpretation

Facilitator guide · Visualizations & Interpretation

About these activities

These activities teach participants to **read a chart and say what it means** — first manually, then with the AI, ending in a real apply activity on country data. They deliberately pair a "do it yourself" path with an "AI does it, you verify" path, for both building charts and writing interpretations.

Six handouts. ~100 min of participant time.

How to run it

- Start with the **reading framework** (handout 1) — it is the reference everything else builds on.
- The sequence pairs **a full manual pass** (handouts 2 + 3) with **a full AI pass** (handouts 4 + 5), so participants complete the whole build-and-interpret loop themselves before they see the AI do it.
- For each platform task, **demo it first**, then let participants follow the handout. The handout re-explains what you showed.
- The through-line: the AI is fast, but the participant is accountable. Reinforce verification every time the AI appears.

The activities

1. How to read a FASTR visualization

Reference · ~10 min

What it is — a reusable reference: a six-step framework for reading any chart.
What the handout covers — the six steps (indicator, level/period, comparison, values, what stands out, so-what), how to choose chart types, and practice on an existing deck with a teammate.
Watch for — misreading the y-axis is the single most common mistake. Remind participants to check the legend, axes and footnotes *before* interpreting.

2. Create your first visualization

Activity · ~15 min

What it is — a hands-on activity creating a chart with the built-in builder (the **Metric → Presets → Create** wizard).
What the handout covers — + Create visualization → pick a metric (e.g. *M3. Service utilization → Number of services reported*) → choose a ready preset like *Service volume over time (monthly)* → Create. The handout also explains **filter vs disaggregate**.
Watch for — participants confuse **filter** (show a slice, hide the rest — e.g. *only ANC1*) with **disaggregate** (break a total into its parts on one chart — e.g. *one line per district*). Reinforce the difference out loud — it underlies every chart they build. The quick path is metric → preset → Create; **Custom** is only needed for manual control (chart type + disaggregation). Also: line charts for trends, bar charts for comparing.

3. Write an interpretation for a chart

Activity · ~20 min

What it is — a writing activity teaching the three-part interpretation structure for a slide.
What the handout covers — a message-carrying title, a facts-only "what you see", and an action-oriented "what it means", added alongside a chart on a slide.
Watch for — titles that merely describe ("Coverage results"), facts mixed with interpretation, and vague so-whats that name no person or next step.

4. Build a visualization with the AI Assistant

Activity · ~15 min

What it is — a hands-on activity producing the same chart via plain-language AI requests.
What the handout covers — type a chart request, review whether the AI matched the ask (indicator, period, adjusted vs raw), iterate in short turns, and save.
Watch for — participants trust the first answer. They must verify indicator, period, chart type — and especially **adjusted vs raw data** — before saving.

5. Let the AI draft the interpretation

Activity · ~15 min

What it is — a hands-on activity using the AI to draft interpretation text, then verifying it.
What the handout covers — prompt the AI for an interpretation, verify each claim against the chart, refine in plain language, and add local context the AI cannot know.
Watch for — trusting confident-sounding AI text. Every claim must be checked against the chart, and the recommended action must be owned by the participant.

6. Apply — spot a disruption

Activity · ~25 min

What it is — a capstone apply activity using real country data to identify a disruption and write a finding.
What the handout covers — country teams pick a flagged indicator, open its disruption chart, work the six-step framework, add local context, write a three-part finding, and share it with the room.
Watch for — a disruption is rarely a single-month dip. Steer teams toward sustained drops (3+ months); remind them that stable volumes can still mean falling coverage if population is growing.

Wrapping up

Activity 6 is the proof these activities worked: a team that can pick a real disruption and state it clearly has the core FASTR skill. Use the share-back to surface and correct weak findings.
