

Import facility structure

Instance Setup · ~20 min

BEFORE YOU START

- You've read **Before you begin** (you know your DHIS2 URL + credentials)
- You know which level in your DHIS2 hierarchy corresponds to *facility* (often level 4 or 5)

What you'll do

Pull your country's facility registry — every facility with its region and district — directly from DHIS2 into FASTR. The administrative areas are **derived automatically from the facility rows**: you never manage admin areas separately. After this, every analysis can disaggregate results by region, district, or facility.

1 Open the Facilities registry

1. Click **Data** in the top navigation. The page is organized into **General**, **HMIS**, **HFA**, and **ICEH** sections.
2. In the **HMIS** section, click the **Facilities** card.

Demonstration site → FASTR

Data

General

Admin area labels
Not set — using default names

HMIS

Configuration	DHIS2 connection	Facilities	Indicators	Data
Admin area depth: 4 Facility columns: 4	Server: https://dhis2.org/web...	Facilities: 107 Admin area 2: 4 Admin area 3: 18 Admin area 4: 18	Common indicators: 14 DHIS2 indicators: 9 Custom indicators: 3	Has data

GeoJSON maps
No GeoJSON maps attached

HFA

Configuration	Facilities	Time points	Sampling weights	Indicators
Admin area depth: 4 Facility columns: 4	Facilities: 107 Admin area 2: 4	Time points: 4	No weights imported	HFA indicators: 248

2 Import from DHIS2

Start a DHIS2 import from the Facilities page. The **stored DHIS2 connection** appears — the one set up once for the whole instance via **Manage connection**. Confirm it.

No stored connection yet? An administrator sets it up once — URL (with <https://>), username, password — and it is saved encrypted for the whole instance. Nobody re-types credentials after that.

3 Select the facility level

Select **Facility**. FASTR's analysis modules require facility-level data — they aggregate up from facilities to districts and regions internally, not the other way around. Selecting *Facility* brings all the levels above it (district, region, ...) along automatically.

Launch the import and wait for it to complete — usually 30 seconds to a few minutes depending on country size.

Checkpoint

- The **Facilities** page lists your country's facilities with their admin areas.
- Back on the **Data** page, the Facilities card shows the counts — facilities, and admin areas at each level. Check they are plausible for your country.

Admin area 3: 16

Admin area 4: 99

Download from the facilities menu – imports and removes administratively by imports.

What could go wrong

- **Empty facility list** — the DHIS2 user behind the stored connection may not have read access to org units. Check with the DHIS2 admin.
- **Hierarchy looks wrong** — the wrong level was picked. Re-import with the right level; existing facilities are updated, not duplicated.
- **Authentication fails** — usually a malformed URL (missing `https://` or a trailing slash) rather than a wrong password. Fix it via **Manage connection** on the Imports page.
- **Import hangs** — large countries (1000+ facilities) take longer. Wait at least 5 minutes before retrying.

What's next

Move on to **Import and map indicators**.
