

Setting up admin areas

Activity · Instance Setup · ~25 min

Objective

Configure your country's administrative hierarchy (regions, districts, facility types) in the FASTR Analytics Platform so that downstream analysis can disaggregate results correctly.

Instructions

1. Open the **Admin** tab in your country instance.
2. Navigate to **Organisation units** → **Manage hierarchy**.
3. Add your top-level administrative areas (typically regions or provinces).
4. Add the second-level areas under each (typically districts).
5. Save and verify the tree renders correctly on the right-hand preview.

Worksheet

Capture the admin structure for your country before clicking through:

Level	Name in your country	Example value
Level 1 (top)		<i>e.g., Region, Province</i>
Level 2		<i>e.g., District, County</i>

Notes

Tip: Stop and verify after each level. It's much harder to fix a misconfigured hierarchy after data is imported.

If your country has more than three hierarchical levels, configure the top three first and add deeper levels later as needed.
