Facilitator guide — Getting Started

Facilitator guide · Getting Started · 3 activities · ~15 min + demo

Purpose

Getting Started puts every participant onto the platform and set up to keep their work organized. It is a short module — one facilitator-led demo followed by two quick activities — but it is a gate: a participant who is not logged in, inside their country project, with a named folder in both tabs will be stuck for the rest of the workshop. The obstacles here are accounts and access, not skills.

By the end, every participant should be signed in, inside their country project, with a personal folder of the same name in both the Slide Decks and Visualizations tabs.

Session at a glance

#	Activity	Time	Format
—	FASTR platform demo	~10 min	Facilitator-led (appendix)
1	Log in to the platform	~10 min	Hands-on, individual
2	Create your user folder	~5 min	Hands-on, individual

Running the session

Preparation. Resolve accounts and project access *before* the session if at all possible. The recurring time sink here is verification emails and un-approved accounts — neither of which a participant can fix themselves, and both of which stall the room. Have the platform demo loaded (appendix) and the *Logging in* handout ready to distribute after it.

How to demonstrate. Start with the platform demo (appendix) — a brief, high-level tour of the main tabs before anyone logs in. Keep it short and resist going deep; detailed setup is a later session. Then let participants log in and create their folders from the handouts.

Grouping. Both activities are individual. Pair participants for help if someone is stuck on access.

Pacing. This module is short, but do not declare it finished early. Check every participant has cleared the gate (logged in, in project, folders made) before moving on — an unresolved access problem only gets more expensive later.

The message to carry through. Organization now prevents chaos later: one folder per person, the same name in both tabs, is the simple habit that keeps a crowded country project navigable.

The activities

1. Log in to the platform · ~10 min · hands-on

What happens. The first hands-on activity: participants open their country URL, sign up or sign in, verify their email, log in, and click into their country's project on the Projects tab.

Demonstrate. Covered by the platform demo (appendix). After it, point participants to the *Logging in* handout and let them work.

Say something like. *"If your verification email hasn't arrived in two minutes, check spam. If your country project isn't listed after login, tell me — that's an access grant I need to make, not something you can fix."*

What a good result looks like. Each participant inside their country project, with their name in the top-right and the navigation tabs visible.

Watch for.

- Verification emails landing in spam.
- "Account not approved" or a missing project — both need *you* to grant project access or re-trigger the email. Pre-empt these before the session.

2. Create your user folder · ~5 min · hands-on

What happens. A short setup activity: participants create one personal folder named after themselves in the Slide Decks tab, and another with the **identical name** in the Visualizations tab.

Demonstrate. Show that **+ New folder** appears only in the **By folder** view, and that the names must match exactly across both tabs.

Say something like. *"Use your own name, and the same name in both tabs. Avoid 'test' — everyone's 'test' folder collides, and you'll never find your work again."*

What a good result looks like. A folder with the participant's name in both tabs, identically named.

Watch for.

- The **+ New folder** button missing — they are not in the **By folder** view.
- Mismatched names across the two tabs, which makes work hard to find later.
- Generic names like "test" — discourage them.

Wrapping up

Every participant should leave logged in, inside their country project, with a named folder in both tabs. Anyone who is not will be blocked for the rest of the workshop — check before moving on.

Appendix — FASTR platform demo script

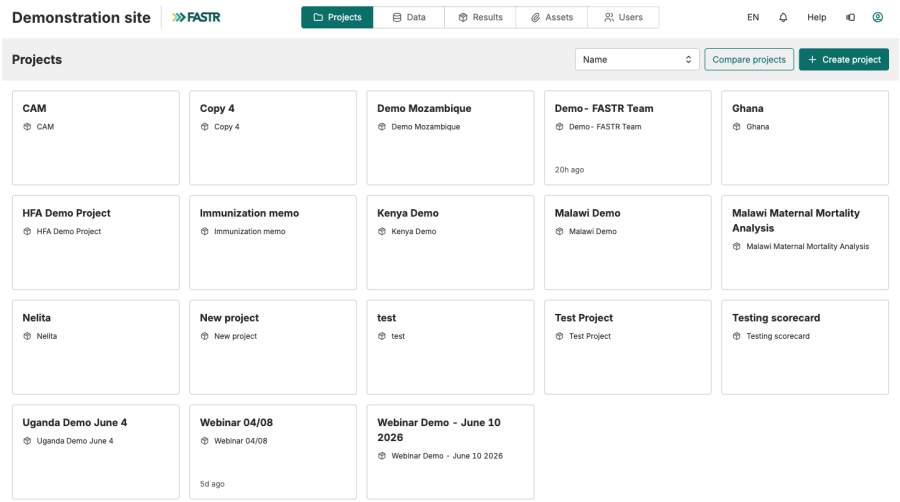

A quick orientation tour of the FASTR Analytics Platform — enough that participants know what they're looking at when they log in next. This is **before** they touch their own keyboards. Keep it short and high-level; details come in the hands-on activities.

Setup checklist

- ☐ Browser logged in to your country instance, with a demo project loaded
- ☐ Project open, left sidebar visible: Reports, Decks, Dashboards, Visualizations, Metrics, Results package (AI button bottom right)
- ☐ At least one analysis already run, so charts/outputs are visible
- ☐ Screen-share working if remote
- ☐ Have the participant *Logging in* handout ready to hand out after this demo

Step 1: The platform at a glance

- **Do:** Show the landing screen with the main navigation across the top.
- **Say:** *"This is your country's instance of FASTR. Everything you'll see today happens here — there's no separate software to install."*

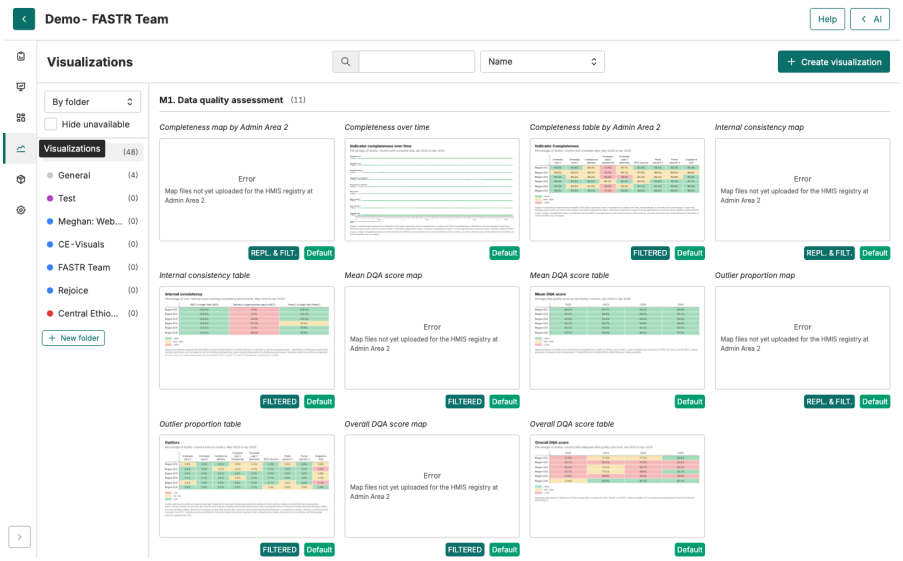

- **Watch for:** Participants asking "is this the same as DHIS2?" — answer: *"No. FASTR reads from DHIS2 but adds analysis, visualization, and reporting on top."*

Step 2: Where the data lives (instance level)

- **Do:** Briefly show the **top navigation** (Projects · Data · Results · Assets · Users) and click **Data** — the instance-level page with the **HMIS** cards.
- **Say:** *"Admins import data here, at the instance level. Projects don't hold data — each reads a **results package** of already-computed analyses."*
- **Watch for:** Don't go deep here — just orient. Setup is its own session.

Step 3: Visualizations tab

- **Do:** Open the **Visualizations** tab. Show a saved chart.

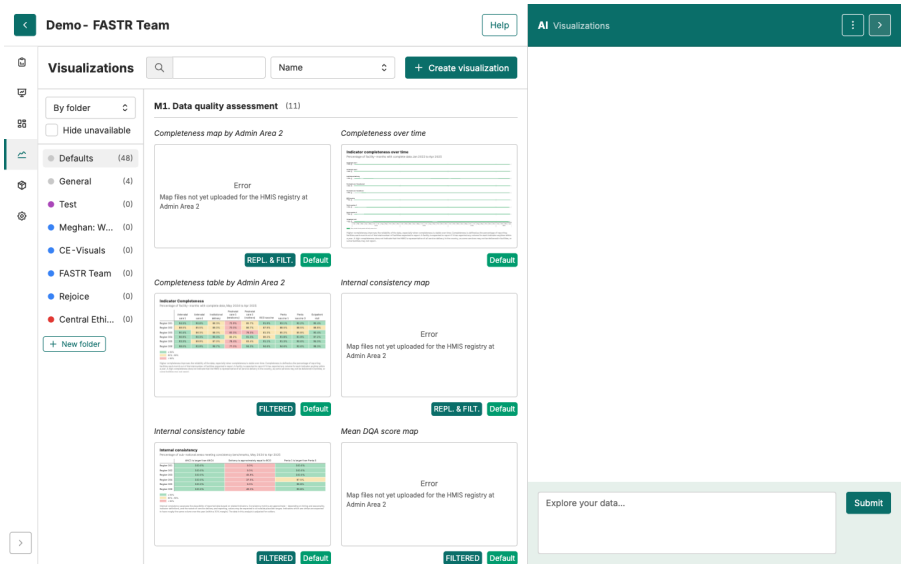

- **Say:** *"Once data is loaded, you create charts here. You can also save them to your personal folder — we'll do that in the next activity."*
- **Watch for:** Mouse over a chart to highlight that the data is interactive (hover values, filters).

Step 4: Slide Decks tab

- **Do:** Open **Slide Decks**. Show an existing deck and a content slide with a chart + interpretation.
- **Say:** *"This is where you'll build the outputs you share with decision-makers. Each slide has a chart and an interpretation — both editable."*
- **Watch for:** Participants ask whether it's like PowerPoint — answer: *"Same idea, but the charts stay linked to your data."*

Step 5: AI Assistant

- **Do:** Open the AI Assistant panel. Show the prompt library briefly.

- **Say:** *"There's an AI assistant that can help you build charts, interpret outputs, and draft slides. We'll have a whole session on this later in the week."*
- **Watch for:** Don't demo a prompt here — keep curiosity for the dedicated AI session.

Common questions

Q: Do I need a DHIS2 password to log in to FASTR?
A: No. FASTR has its own login. DHIS2 credentials only come into play when you import data (a separate step).

Q: Is my work private to me?
A: Anything you save to your personal folder is yours. Anything saved to project-level folders is visible to your country team.

Q: Can I use this on my phone?
A: Technically yes, but it's designed for a laptop — the visualizations need screen space.

Backup plan

If the platform is unavailable during your demo, fall back to slides:

- Use the screenshots in the *Logging in* handout to walk through the landing screen.
- Skip the live demo and go straight to the participant activity.
