

AI verification checklist

Reference · Report Builder · ~15 min

Why this matters

The AI Assistant can generate a complete report in a few minutes. **You** are the one who signs off on it. The AI can sound confident and still be wrong — about a number, a region name, a comparison. This checklist is what you and your team run **before** you share an AI-drafted report with anyone outside the team.

The rule: every claim in the report must be checkable against the underlying chart or table. If you can't trace a sentence back to data, flag it.

Before you start

- ☐ The AI has generated your report (Prompt 1 = base disruption report, plus optionally Prompt 2 / Prompt 3)
- ☐ Your country team is together — verification is a team activity, not a solo one
- ☐ You have the source charts open on the platform, next to the report

Prompt 2 — Regional disruption analysis

The AI generates one slide per subnational area, comparing observed vs expected service volumes.

☐	Check	Notes
☐	The summary includes all subnational areas (count them)	
☐	One slide per area — none missing, none duplicated	
☐	Area names are spelled correctly (matches your country's official naming)	
☐	Each interpretation references the right area (not Region A on Region B's slide)	
☐	Observed-vs-expected charts use the same scale across slides so comparisons make sense	
☐	Magnitudes match what's in the source chart (no inflated drops, no missed spikes)	

If a check fails: ask the AI to regenerate the section, naming the issue specifically. *"You mapped the interpretation from Region X to Region Y's slide — please fix slide 7."*

Prompt 3 — Data quality appendix

The AI adds an appendix with completeness, outlier, and consistency checks.

☐	Check	Notes
☐	The appendix is numbered correctly (Annex 1 or 2 depending on whether Prompt 2 also ran)	
☐	All three DQ dimensions present: completeness, outliers, internal consistency	
☐	The colour code is logical : green = good, red = alert. No inverted scales.	
☐	Low-quality areas or indicators are explicitly flagged in the text, not hidden in a chart	
☐	The DQ scores match what you see on the platform (open the DQA module side-by-side)	

If a check fails: the AI may have mis-read the underlying DQA outputs. Re-prompt with:
"Re-check the DQ slides — the [completeness / outlier / consistency] chart for [area] does not match the platform."

Final read-out-loud

Once both checklists pass, read **every interpretation in the report out loud as a team**. Listen for:

- **Anything that sounds wrong** – a number that's too round, a trend that's not in the chart
- **Anything that sounds exaggerated** – "dramatic", "alarming", "unprecedented" without evidence
- **Anything generic** – sentences that could apply to any country, not yours
- **Missing local context** – the AI doesn't know about the recent strike, the supply chain issue, the new policy. You need to add it.

If anyone in the room hesitates on a sentence, **flag it**. Hesitation usually means something is off.

Sign-off

By the time you share this report outside the team, the team must be able to say:

"Every number is checkable. Every interpretation reflects what we know. No sentence is generic. No claim is unsupported."

If you can't say that yet, keep iterating.

What's next

Once the report passes verification, finalise the formatting (titles, page numbers, logos), export, and disseminate using your country action plan.
