

Add a visualisation + interpretation text

Reference · Slide Decks · ~5 min

What this handout is

A short reference for the **layout of a content slide** — how to add a chart on one side and interpretation text on the other. Use this with the next two activities (adding a visualisation manually, or via the AI Assistant).

The three building blocks

1. Add a visualisation

In the slide editor, choose **Block** → **Visualisation** → **Select visualisation** → browse your saved charts → click **Select**.

The chart appears on the slide. By default it takes the full slide width.

2. Add text next to it

Right-click in the slide preview → **Add** → **Col to right** → click the new text area and start typing.

Use # for headings. A short headline at the top of the text column anchors what the chart is showing. One sentence below it is the takeaway.

 **Right-click menu showing "Add → Col to right"**

resources/screenshots/m9d/col_to_right_menu.png

3. Edit slide details and save

Switch to the **Slide** tab (in the editor panel) → edit the slide title, subtitle, and date → click **Save**.

Layout tips

Two columns is the default for a reason. Chart on the left, takeaway on the right, headline at the top. Don't try to fit four columns on one slide — split into two slides if the content demands it.

- **More options:** Right-click → **Add** → **Row below** — useful for footnotes or a source line at the bottom.
- **Resize anytime:** the vertical divider between chart and text is draggable (see *Editor walkthrough* facilitator handout).

What's next

Use this reference while doing **Add a visualisation (manually)** or **Add a visualisation (with the AI Assistant)** — the next two activities.

 **Verify in your current UI:** menu paths and naming may differ slightly. The three-step layout (visualisation → text column → save) is unchanged.
