

Log in → Your folder

Log in to the platform

Activity · Getting Started · ~10 min

BEFORE YOU START

- ☐ You watched the facilitator's platform demo
- ☐ You have your **country platform URL** (your facilitator will share it)
- ☐ You have a working email address you can check during the activity (you'll need to verify it)

What you'll do

Create a FASTR account if you're new, sign in, and confirm you're in your country's project. This is your first time touching the platform — no data work yet.

1 Open the platform URL

Go to your country's platform URL in a browser (your facilitator will share it; the format is usually `https://<country>.fastr-analytics.org`).

You should land on a login screen.

2 Sign up or sign in

- If this is your **first time**: click **Sign up**, enter your email + a password, and create the account.
- If you already have an account: click **Sign in** and enter your credentials.

3 Verify your email

Check your inbox for a verification email from FASTR. Click the link in it to confirm your account.

If you don't see it within 2 minutes, check your spam folder.

4 Sign in

Go back to the platform and sign in with your verified email + password.

5 Find your project

After login, you land on the **Projects** tab. You'll see the projects you have access to:

- **If you're an instance admin**, every project on the instance is listed.
- **Otherwise**, you only see projects an admin has granted you access to. If your country's project is missing, ask your facilitator (or instance admin) to grant access.

Click your country's project to enter it. The project opens with a **left sidebar of icons** — AI Assistant (sparkle), **Visualizations** (chart), **Slide Decks** (brackets), **Data** (database), and **Settings** (gear). Hover an icon to see its label.

Note: the **top navigation** (Projects · Data · Assets · Users · Settings) is for **instance admins** managing the whole site. Inside a project the left-sidebar icons are what you'll use day to day.

Checkpoint

After clicking into your project, you should see:

- Your name (or email) in the top-right corner
- The left sidebar of project icons (Visualizations, Slide Decks, Data, Settings)
- The project name in the header (e.g., "Country X — Workshop project")

If yes, you're in. Move to the next activity.

What could go wrong

- **"Account not approved"** — your account needs to be added to the country project by an administrator. Ask your facilitator to add you.
- **Verification email never arrives** — check spam. If still nothing after 5 min, ask your facilitator to re-trigger it.
- **"Invalid email or password"** after sign-up — double-check the email you entered. Typos are common. You can usually request a password reset.
- **No projects visible on the Projects tab (or your country's project is missing)** — you're not an instance admin and haven't been granted project access yet. Ask your facilitator or instance admin to grant you access to your country's project.

 **Verify in your current UI:** the login + sign-up screens may have evolved; field labels can differ from the screenshots. The flow is the same.

What's next

Move on to **Create your user folder** — set up personal folders in the Slide Decks and Visualizations tabs so your work stays organised.

Log in → Your folder

Create your user folder

Activity · Getting Started · ~5 min

BEFORE YOU START

- ☐ You've completed **Log in to the platform** (you can see the main navigation tabs)
- ☐ You're inside your country's project

WHY IT MATTERS

The country project gets crowded fast. A dozen people saving charts and decks into a shared space without a system means nobody can find anything later. **One folder per person** is the simplest rule that works.

What you'll do

Create two personal folders — one in **Slide Decks**, one in **Visualizations** — to keep your work organised. Everything you save here will be tagged with your name so the team can see who built what.

1 Folder in the Slide Decks tab

1. Click the **Slide Decks** tab in the top navigation.
2. Switch the view to **By folder** (the toggle at the top — the other option is *Flat list*). You'll only see **New folder** when *By folder* is selected.

By folder

3. Click **New folder**.
4. Type your name (e.g., **Aïcha N.** or **John S.**).
5. Click **Save**.

You should see your new folder appear in the list. Click on it to open it — it's empty for now, but everything you create going forward can be saved here.

2 Folder in the Visualizations tab

Same idea, different tab — and the view toggle has four options here:

1. Click the **Visualizations** tab.
2. Switch the view to **By folder** (the toggle offers *By module*, *By folder*, *By metric*, and *Flat list*). **New folder** is only visible in *By folder*.
3. Click **New folder**.
4. Type your name (use the **same name** as in step 1 so your work is easy to find across tabs).
5. Click **Save**.

Checkpoint

You should now have:

- One folder with your name in **Slide Decks**
- One folder with the **same name** in **Visualizations**

Both folders are empty. That's fine — the next activities will fill them.

Naming conventions

Use the same name in both tabs. Mismatched names (e.g., "Aïcha" in one, "A. Niang" in the other) makes it hard for the team to find your work later.

- Avoid generic names like "my folder" or "test" — your country teammates will create folders too, and "test" will overlap with others.
- Accents and spaces are fine in folder names.

What could go wrong

- **"New folder" button doesn't appear** — you're most likely in the wrong view. Switch the view toggle to **By folder** (not *Flat list* / *By module* / *By metric*). If it still doesn't appear, you may not have permission — ask your facilitator to check your role.
- **Folder doesn't save** — the network may have dropped. Refresh the page and try again. If the folder already exists with your name, it'll show in the list.
- **You see other people's folders** — that's expected. The whole country team works in the same project, so everyone's personal folders are visible. Yours is just one row in that list.

 **Verify in your current UI:** tab names + the "New folder" button location may differ from older screenshots. The flow is the same.

What's next

Setup complete. From here, you'll start running real analyses — the next module covers **Creating visualizations**.

How to read a FASTR visualization

Reference · Visualizations & Interpretation · ~10 min

WHAT THIS HANDOUT IS

A short reference you'll use over and over. A chart is a question rendered as a picture — before you build one, or ask the AI for one, you need to be able to *read* one. Keep it next to you during the next activities.

The six-step framework

Use this every time you open a chart, whether you built it or someone else did:

Step	Ask yourself
1. What indicator?	What health metric is shown? (ANC1, ANC4, vaccination coverage, ...)
2. What level & period?	National, regional, district, facility? What time range?
3. What is being compared?	Actual vs. expected? District vs. district? Change over time?
4. Read the values	What's the magnitude — high, low, changing?
5. What stands out?	Trends, gaps, spikes, disruptions, anomalies
6. So what?	What does this mean for service delivery? What action would it prompt?

Tip: Always check the legend, axis labels, and any footnotes *before* you start interpreting. Misreading the y-axis is the single most common mistake.

Choosing the right chart type

Different questions call for different charts. Two patterns cover most FASTR outputs:

- **Line chart** — best for **trends over time**. One or two indicators, monthly values. Easy to see direction.
- **Heatmap** — best for **comparing many places at once**. Districts × indicators in one view. Easy to spot which places are off-pattern.

When you want to see...	Use
How one indicator changed over the last 12 months	Line chart
How 25 districts compare on the same indicator	Heatmap
Two indicators on the same time axis	Line chart (dual series)
One indicator, one period, across a few districts	Bar chart

When in doubt: start with a line chart for one indicator, or a heatmap for many.

Quick test — try the six steps

Open the slide deck or report you've been working on with the AI Assistant. With a teammate, walk through the six steps on each chart in it. Notice where you slow down — that's usually where a chart is missing a label, or where the question it's trying to answer isn't clear yet.

What's next

You'll build your own visualization next — first manually, then with the AI Assistant. Both end with this same six-step framework to interpret what you produced.

Reading a viz → **Build manually** → Build with AI → Write interpretation → AI interpretation → Spot disruption

Create your first visualization

Activity · Visualizations & Interpretation · ~15 min

BEFORE YOU START

- ☐ You're signed in and looking at your country's project
- ☐ You're in the **Visualizations** tab
- ☐ You have a folder of your own (or you can use the shared one)

What you'll do

Create your first chart using the built-in builder: pick a **metric**, choose a **ready-made chart**, and it's saved to the project. You'll click through the builder yourself; the next activity does the same with the AI Assistant.

1 Open the visualization builder

In the Visualizations tab, click **Create visualization**. A three-step builder opens: **Metric** → **Presets** → **Configure**.

2 Pick a metric

Metrics are grouped by module on the left (M1. Data quality, M3. Service utilization, M4. Coverage...). A metric is **what is measured** — e.g. *Number of services reported, Actual vs expected service volume, Coverage*.

For a service-volume trend, open **M3. Service utilization** and pick a metric such as **Number of services reported**. Click **Next**.

3 Choose a ready-made chart

You'll see a grid of **presets** — ready-made charts. Choose **Service volume over time (monthly)** — a line chart of monthly volume by indicator. Click **Create**.

Your chart is created and appears in the **Visualizations** list. Use the **By folder** view to drop it into your folder.

The other presets give quarterly or annual **bar** charts. **Custom → Configure manually** lets you choose the chart type (table, time series, bar, map) and how to break the data down — see the next section.

Filter vs disaggregate — what's the difference?

These two words come up a lot. They are not the same:

- **Filter = pick what to show.** Choose the indicators, places, or months you want — only those appear. e.g. *show ANC1 only*, or *Northern region only*. Like a spotlight: you point it at what you want to see.
- **Disaggregate = break it down.** Split one total into its parts so you can compare them — e.g. *one line per indicator*, or *one bar per district*. Nothing is hidden; the total is shown as its pieces.

FILTER = choose what to show

All indicators are available

☐ ANC1

☐ ANC4

☐ BCG

☐ Penta

You picked ANC1 → only ANC1 shows

☒ ANC1

☐ ANC4

☐ BCG

☐ Penta

You pick what you want to see.

Whatever you don't tick simply isn't shown — like a spotlight.

DISAGGREGATE “ANC1 by district” — four ways to display the parts

Lines
one line per district

Grid
a mini chart for each

District	Visits
Dist A	900
Dist B	850
Dist C	1,000
Dist D	800

Rows
one row per district

Dist A	Dist B	Dist C	Dist D
900	850	1,000	800

Columns
one column per district

Example. Start with *total ANC1 visits, nationally*. **Filter** to "Northern region" → now you see only Northern's ANC1. **Disaggregate** "by district" → the same total split into one bar (or line) per district.

Where you do this when you edit a viz

Open a saved visualization — the controls live in the **left panel**, and you'll often need to **scroll down** to find them (this is where people get lost). Two sections do the work:

- **Filter (subset)** — **pick what you want to see**: set the time period, and tick the indicator(s) you want. Only what you tick appears.
- **Display (disaggregate)** — choose **how the parts are shown**. The dropdown gives four options:
 - **Lines** — one line per part, all on the same chart
 - **Grid** — a separate little chart for each part, side by side
 - **Rows** — one table row per part
 - **Columns** — one table column per part

Data	Presentation	Text
Metric Actual vs expected service volume		
Presentation type Timeseries		
Filter (subset) ☐ Data values ☒ Time period ☒ Last N months ☐ From specific month to present ☐ Last N full calendar years ☐ Last N full calendar quarters ☐ Custom Number of months = 12 <input type="range"/>		
☒ Indicator ANC1 ANC4 BCG DELIVERY OPD PENTA1 PENTA3 PNC1_MOTHER PNC1_NEWBORN		
Display (disaggregate) ☒ Data values (Required for this visualization) Lines		

Watch out when you use both together. Here's the trap, with an example. You split a chart **by district** because you want to compare the districts. Then you **filter** it down to just one district — so the others disappear. Now you're looking at a single district on its own, and there's nothing left to compare.

The simple rule: use **filter** to pick the data you want to look at, and use **disaggregate** to split it into the parts you want to compare. Just don't filter down to only one of the things you wanted to compare.

Try a few options

Repeat with a different metric or preset — a coverage metric under **M4**, or the quarterly-change bar chart — to see how each reads.

Tip: Line charts (*Service volume over time*) are best for trends over time. Bar charts (*quarterly / annual change*) are better for comparing periods or places. The reference handout *How to read a FASTR visualization* goes deeper.

Check yourself

You should now have:

- At least one chart created and visible in your **Visualizations** list
- The path in muscle memory: **Create visualization** → **Metric** → **Presets** → **Create**
- A sense of which presets suit trends vs comparisons

What's next

The next activity does the same thing using the AI Assistant — typing a request in plain language instead of clicking through the builder. Same end result, different path.

 **Verify in your current UI:** labels (*Create visualization*, *Create*) may differ slightly. The **Metric** → **Presets** → **Create** path is the key structure.

Write an interpretation for a chart

Activity · Visualizations & Interpretation · ~20 min

BEFORE YOU START

- You have at least one chart saved in your Visualisations folder
- The *Reading a viz* handout is next to you for the six-step framework

WHY IT MATTERS

A chart on its own is just a picture. The **interpretation text** is what turns it into something a decision-maker can act on.

What you'll do

Pick a chart, read it carefully, then write a three-part interpretation next to it on a slide. The interpretation is what a director will read, so each part has to earn its place.

The three-part structure

Part	What it does	Example
Title	The message in one sentence	<i>Northern Region ANC1 dropped 12% in Q1 2026 vs Q1 2025</i>
What you see	The chart in plain words: trends, magnitudes, anomalies. Facts only.	<i>Monthly volumes fell from ~8,500 to ~7,500, concentrated in three districts.</i>
What it means	The so-what. The action it would prompt.	<i>Supportive supervision visits in those three districts, plus a DQ check.</i>

The five steps

1 Pick a chart from your folder

Open the **Visualisations** tab and choose one of the charts you saved earlier. Pick one that shows movement (a trend, a drop, a regional contrast) — not a flat line. A flat chart is hard to write about and harder to act on.

2 Read the chart with the six-step framework

Before writing anything, walk through the chart using the *Reading a viz* framework. Talk it through with a teammate if you can:

1. What indicator is shown?
2. What level and period?
3. What is being compared (actual vs expected, districts, time)?
4. What are the values?
5. What stands out — trends, drops, spikes?
6. So what — what does this mean for service delivery?

Steps 1–5 give you the facts. Step 6 is your interpretation seed.

3 Write the title

Lead with the **message**, not a description. If a director read only the title, would they get the finding?

- Weak: *Coverage results*
- Strong: *Northern Region ANC1 dropped 12% in Q1 2026 vs Q1 2025*

4 Write "what you see"

Describe the chart in 1–3 sentences using your answers to steps 1–5. Numbers, trends, comparisons.

No interpretation yet — keep it to what is visible on the chart. The reader needs to trust your description before they trust your conclusion.

5 Write "what it means"

The so-what, drawn from step 6. **What action would this prompt?** Be specific. *"Supportive supervision visits in three districts, plus a check on the DQ scores for those facilities"* — not *"improve performance"*.

6 Add to your slide

In the Slide Decks tab, open your deck and add the chart. Place your three-part text alongside it. Save.

Pitfalls to avoid

- **Title as description** — *"Coverage results"* tells the reader nothing. Use the headline finding.
- **Mixing facts and interpretation** — keep "what you see" facts-only.
- **Vague action** — if the so-what does not name a person, place, or next step, rewrite it.

What's next

The next handout shows how the AI Assistant can draft this interpretation for you, and how to verify and refine what it gives you.

Build a visualization with the AI Assistant

Activity · Visualizations & Interpretation · ~15 min

BEFORE YOU START

- ☐ You've built at least one chart manually (previous handout)
- ☐ You're signed in and your folder is open
- ☐ You know which indicator you want to chart (ANC1, Penta3, ...)

What you'll do

Get the AI Assistant to create the same kind of chart you just built manually — but by typing a request in plain language. Same end result, different path.

1 Open the AI Assistant

In the **Visualizations** tab, open the AI chat panel (right side of the screen). Type a short request like:

"Show me a time-series chart of ANC1 visits over the last 12 months, using the adjusted data."

Adjusted data = data corrected for missing reports (completeness) and extreme values (outliers). It's the cleaner version of your country's data.

2 Review what the AI returns

The AI proposes a chart with the indicator, period, and chart type it inferred. **Check it against what you asked for:**

- Right indicator? Right period?
- Line chart (for trends) or something else? Did it pick what makes sense?
- Adjusted vs raw — did it use the version you asked for?

If anything is off, **say so in plain language:** *"Use raw data instead"* or *"Switch to a bar chart"*.

3 Iterate

Don't expect the first answer to be perfect. Refine in short turns:

- *"Break it down by region."*
- *"Add Penta3 on the same axis."*
- *"Show only the last 6 months."*

Each instruction is a small step. The AI updates the chart and you keep going.

4 Save it

When you like what you see, click **Save** and put it in your folder. Give it a clear name (the AI may suggest one — feel free to keep or rename).

Try it with three indicators

Run the same flow with three different indicators — pick from different programmes (ANC, immunisation, delivery). You'll get a feel for how the AI interprets short requests.

Manual vs AI — when to use which

- **Manual** when you know exactly what you want and clicking is faster than typing.
- **AI** when you want to explore — *"show me something useful about X"* — or when you don't remember the exact filter names.

The AI is an accelerator, not a replacement. You're still the one who decides whether the chart answers your question.

What's next

The next handout is about **writing the interpretation** — the text that goes next to your chart on a slide. Use the six-step framework from the *Reading a viz* reference.

 **Verify in your current UI:** button labels and the AI chat layout may differ slightly. The flow (ask → review → iterate → save) is the same.

Reading a viz → Build manually → Build with AI → Write interpretation → **AI interpretation** → Spot disruption

Let the AI draft the interpretation

Activity · Visualizations & Interpretation · ~15 min

BEFORE YOU START

- ☐ You have a chart on a slide (from the previous activity)
- ☐ You've written one interpretation by hand — so you know what "good" looks like
- ☐ You have the *Reading a viz* reference handout next to you

WHY IT MATTERS

The AI's text is a **draft**, not a final answer. **You are responsible** for what gets put on the slide.

What you'll do

Use the AI Assistant to draft an interpretation for your chart — then verify and refine what it gives you. Same end result as writing by hand, but faster as a starting point.

How this works

The AI looks at your chart, reads the underlying data, and proposes text. It handles the **describing** — you handle the **explaining** and the verification.

1 Ask the AI for an interpretation

In the slide editor, open the AI chat and type:

"Write an interpretation for this chart. Cover what you see and what it means for service delivery."

The AI reads the data behind the chart and proposes a title + 2–3 sentences.

2 Verify what the AI gave you

Read it slowly. For every claim the AI makes, ask:

- ☐ Is this **actually visible in the chart**? (No hallucinations.)
- ☐ Are the **numbers right**? Compare against the chart's values directly.
- ☐ Is the **so-what realistic** for your country context?
- ☐ Does the **title carry the message**, or is it just a label?

3 Refine in plain language

If something is wrong or vague, **say so**:

- *"The drop you mentioned isn't in the chart — please re-check."*
- *"Reframe the so-what for a director of PHC, not a data manager."*
- *"Make the title a finding, not a description."*

The AI rewrites. Iterate until the output passes your verification.

4 Add your local context

The AI doesn't know what's happening on the ground. Add:

- **Local events** (a strike, a stockout, a recent campaign)
- **Programmatic nuance** (is this a real problem or an artefact?)
- **Recommendations** rooted in what your country team knows

Pitfalls to avoid

- **Trusting the AI without checking.** It can sound confident and still be wrong. Verify every claim against the chart.
- **Skipping the local context.** A generic interpretation feels generic. Yours should reflect what *your country team* would say in a room.
- **Letting the AI write the action.** The action belongs to you — the AI can't know who the decision-maker is or what's politically feasible.

What's next

The final handout in this series puts it all together — **spotting a disruption** in your country's data and writing a full interpretation that links it to action.

 **Verify in your current UI:** the AI chat layout and prompt placement may differ slightly. The verify-then-refine loop is the same.

Apply — spot a disruption

Activity · Visualizations & Interpretation · ~25 min

BEFORE YOU START

- ☐ You've completed the previous 5 handouts (you know how to build, interpret, and AI-assist)
- ☐ Your country team has an indicator in mind — one that someone has flagged a concern about
- ☐ You're in the **Visualizations** tab, with your country's data loaded

What you'll do

Take everything you've practised and apply it to a real question. Open the disruption chart for one indicator, work through the six-step framework, and produce a finding statement your country team would actually use.

The exercise

Pick **one indicator** that matters for your country — ANC1, Penta3, institutional deliveries, BCG. Open its disruption chart on the platform. Then walk through the six steps from *Reading a viz*.

Step	For this chart
1. What indicator?	
2. What level & period?	
3. What is being compared?	Observed volumes vs expected (predicted from past trends)
4. Read the values	Where do you see red? Where do you see green?
5. What stands out?	Sustained drop? One-month spike? Geographic pattern?
6. So what?	What does it mean? What would you do?

What to look for

A disruption is rarely a single-month dip. **Look for:**

- **Sustained drops** — three or more months below expected
- **Geographic concentration** — which districts drive the trend?
- **Stability vs change** — is the indicator flat, growing, declining?

Volumes can look stable and still be a problem. If uptake is steady but the population is growing, coverage is actually falling. Cross-check with the coverage view if available.

Context to add

Once you've identified a pattern, add what you know that the chart can't:

- Was there **financing or staffing continuity** in this period?
- Have facility surveys flagged **readiness gaps** (drugs, equipment)?
- Is the quality of care holding even if volumes are?

The chart shows the *what*. Your country team brings the *why*.

Write your finding

Use the three-part interpretation structure from the previous handout:

1. **Title** — the message in one sentence
2. **What you see** — facts visible in the chart
3. **What it means** — the so-what, tied to a concrete next step

Share with the room

When each country team is done, share one finding with the larger group. Listen for:

- Are the findings **specific**? (One indicator, one period, one action.)
- Are the so-whats **tied to a real decision-maker** in the team's country?
- Did the country team **bring local context** the chart alone couldn't?

What's next

This is the end of the visualisations & interpretation series. The next module covers **building reports** — putting your charts, interpretations, and findings into a sharable document.

 **Verify in your current UI:** disruption-chart controls and the colour scheme may differ slightly. The look-for-sustained-patterns approach is unchanged.

Create deck → Add manually → Add with AI → Edit & finalise

Create your first slide deck

Activity · Slide Decks · ~10 min

BEFORE YOU START

- ☐ You're signed in to your country's project on the FASTR platform
- ☐ You've created your personal folder in the **Slide Decks** tab (see *Create your user folder*)
- ☐ You have at least one visualisation saved that you'd like to use (see *Creating visualisations*)

What you'll do

Create your first slide deck and add a content slide. This is the container — the next activities fill it with charts and interpretation.

1 Open your folder

Go to the **Slide Decks** tab and click into your personal folder.

2 Create the deck

Click **Create slide deck** at the top of the folder. Name it (e.g., *Q1 2026 review* or your topic), then click **Save**.

+ Create slide deck

3 Add your first slide

Click **Add slide**. Three slide types appear — pick the one you need:

- **Cover slide** — the title page at the start of the deck (deck name, date, your name). One per deck.
- **Section slide** — a divider between parts of the deck (e.g. *"Coverage"*, *"Disruptions"*). Use sparingly.
- **Content slide** — where a chart + interpretation lives. Most of your deck is content slides.

For this activity, pick **Content slide** — that's the one the next activities fill.

You should now see an empty content slide ready for a visualisation and text.

Checkpoint

You should have:

- A new slide deck inside your personal folder, with a clear name
- One empty content slide ready to edit

What's next

Your facilitator will demo how to add a chart and split the slide into chart + text. Then you'll repeat it in **Add a visualisation (manually)**.

 **Verify in your current UI:** button locations and labels (e.g., *Create*, *Add slide*) may differ slightly. The flow is the same.

Create deck → **Add manually** → Add with AI → Edit & finalise

Add a visualisation (manually)

Activity · Slide Decks · ~15 min

BEFORE YOU START

- ☐ You've created your slide deck (see *Create your first slide deck*)
- ☐ You have a saved visualisation you want to include
- ☐ The facilitator has demoed the editor (add a viz, split a slide into chart + text)
- ☐ You're in the **Slide Decks** tab

What you'll do

Add a saved visualisation to the content slide in your deck. Your facilitator has just demonstrated this — the steps below are here so you can repeat it on your own.

Steps

1. Open the deck you created earlier and click into the empty content slide.
2. In the editor: **Block** → **Visualization** → **Select visualization**.
3. Browse your saved charts, pick one **you** created, and click **Select**.
4. Confirm the chart appears on the slide.
5. Save.

Checkpoint

Your slide should now show:

- One of your saved visualisations
- The slide title and date filled in
- The deck is saved

Tips

Reuse, don't recreate. If you've already built a visualisation in the **Visualisations** tab, add the existing one — don't rebuild it inside the slide editor.

- If you can't find your visualisation: check the **Visualisations** tab and confirm it's saved in a folder you can see.
- If the chart looks cramped on the slide: that's expected at this stage. The *Edit and finalise* activity covers resizing.

What's next

Move on to **Add a visualisation (with the AI Assistant)** — the same task, but using the AI as a shortcut.

 **Verify in your current UI:** menu labels may differ. The flow (open editor → Block → Visualisation → Select) is unchanged.

Create deck → Add manually → **Add with AI** → Edit & finalise

Add a visualisation (with the AI Assistant)

Activity · Slide Decks · ~15 min

BEFORE YOU START

- ☐ You've created your slide deck and added a visualisation manually (see prior activities)
- ☐ You have at least one saved visualisation in the **Visualisations** tab
- ☐ The AI Assistant panel is open

What you'll do

Use the AI Assistant to surface a saved visualisation and add it directly to your slide deck — no menu navigation needed. Your facilitator has just demonstrated this; now do it yourself.

Steps

1. In the AI Assistant, type a prompt naming one of **your** saved visualisations: *Display [your visualisation name]*.
2. The AI finds the chart and shows a preview in the chat.
3. Below the preview, look for the button to **add the chart to a slide deck** — pick the deck you created.
4. Save.

No saved chart of your own yet? Use this shared example prompt instead: *Display the quarterly change in service volume visualisation.*

The screenshot shows the FASTR AI Assistant interface. On the left, there's a slide preview titled 'New slide' with the subtitle 'ANC1 Actual vs Expected Service Volume (National)'. The slide content area shows a line chart with a red shaded area. On the right, the AI Assistant chat panel is open, showing a conversation where the user asks to display a specific visualisation, the AI finds it, and then adds it to the slide deck. The chat history includes prompts like 'Add the ANC1 actual vs expected service volume (National) chart to this slide.' and responses from the AI assistant confirming the action.

Checkpoint

Your deck should now have **two slides**: one chart added manually (previous activity), one added via the AI Assistant. They can be the same chart or different — the point is you've used both paths.

Comparing the two paths

Manual path	AI Assistant path
Browse → Select → Insert	Prompt → Click "Add to deck"
Useful when you know exactly which chart you want	Useful when you don't remember the name or want the AI to surface candidates
One chart at a time	Can ask for multiple charts in one prompt

Neither is "better." Pick whichever feels faster for the task.

Tips

The AI sees what you've saved. If a chart isn't in your saved Visualisations, the AI won't find it. Save first, then prompt.

- If the AI returns the wrong chart: name the chart more specifically in your prompt, or include the indicator + region in the request.
- If the **Add to deck** button doesn't appear: the AI didn't recognise the response as a chart-add request. Try rephrasing (*"Add the ANC1 chart to my deck"*).

What's next

Move on to **Edit and finalise your slides** — review and polish what you've built.

 **Verify in your current UI:** the AI chat preview controls may differ. The action (prompt → preview → add to deck) is the same.

Create deck → Add manually → Add with AI → **Edit & finalise**

Edit and finalise your slides

Activity · Slide Decks · ~20 min

BEFORE YOU START

- ☐ Your slide deck has at least two slides with visualisations and interpretation text
- ☐ The deck is saved
- ☐ The facilitator has run through the *Editor walkthrough* demo (so you know where the resize divider and the Header/Content tabs are)

WHY IT MATTERS

The AI generates the content, but the **layout often needs adjusting** — text squeezed, a chart needing room, a headline that doesn't match the data. A two-minute review per slide is the difference between usable and polished.

The four passes

Work through each slide in your deck and make these four passes:

1 Review each slide for accuracy

Read each slide as if you'd never seen the analysis. Does the headline match what the chart shows? Is the interpretation text correct? Mark any slide that needs an AI rewrite.

2 Resize text boxes

Make sure interpretation text is fully visible. Drag the vertical divider between the chart and the text to give text more room if it's running off the edge.

3 Resize and reposition visualisations

Ensure each chart is **clear, well-balanced**, and properly aligned. If a chart looks small, drag the divider the other way (more chart, less text).

4 Adjust layout and spacing

Fine-tune the overall slide: line breaks, alignment, the date and footer. Stop when each slide could be in front of a Director without you cringing.

When to ask the AI to rewrite

Sometimes the interpretation text just isn't right. Rather than rewriting it yourself, go back to the AI conversation and ask:

Rewrite the interpretation for slide [X] to focus on [the angle you want] and shorten it to one paragraph.

The AI will update the slide.

Checkpoint

Each slide in your deck should now:

- Have a clear headline that matches the chart
- Show the chart at a readable size, properly aligned
- Have interpretation text that's fully visible and well-edited
- Have the slide title, subtitle, and date filled in

What could go wrong

- **Resize divider doesn't appear** — click into the slide first to enter the editor view. The divider only shows when a content slide is open.
- **Chart still looks cramped after resizing** — the chart itself may be too detailed for slide format. Open it in the **Visualisations** tab, simplify (fewer series, less text), save, and re-add to the slide.
- **You lose changes** — the editor saves automatically, but the **Save** button at the top of the deck is the safety net. Use it after major edits.

 **Verify in your current UI:** editor panel layout and tab names (*Slide, Content, Header/Footer*) may differ. The four passes apply regardless.

What's next

Your deck is ready to share. The next module (or next session) covers exporting and dissemination.

Create deck → Add manually → Add with AI → Edit & finalise → **Format text**

Format your report text

Activity · Slide Decks · ~10 min

BEFORE YOU START

□ You have a slide with interpretation text that needs structure (a heading, a bulleted list, or some bold emphasis)

□ The slide is open in the editor

WHY IT MATTERS

Plain paragraphs hide the message. A heading, a few bullets, and one bolded phrase pull the reader through the slide in the order you want.

The shortcuts

You can format text using simple symbols, the same way you would in a chat message. The editor turns the symbols into formatted text as soon as you save.

Symbol	Result
# Heading	Large heading
## Subheading	Smaller heading
bold	bold
Start a line with - (a hyphen)	Bullet point
Leave a blank line	Add spacing

Try it

1. Open one of your existing slides and click into the text area.
2. Turn the first line into a heading by adding ## in front of it.
3. Pick one phrase that carries the key message and wrap it in **...** to bold it.
4. If the slide has more than one idea, split them into bullets by starting each line with - .
5. Save and check the rendered slide.

Checkpoint

Your slide should now have:

- A heading or subheading that names what the slide is about
- Bullets where you have a list, rather than a single paragraph
- One or two phrases bolded for emphasis (not more, or the emphasis loses force)

What could go wrong

- **The symbols still show on the rendered slide** — you probably forgot the space after the `#` or `-`. The shortcut needs the space (`# Heading` , not `#Heading`).
- **Everything is bolded** — `**` wrap only the phrase you want to emphasise, not whole paragraphs.
- **Bullets run into each other** — leave a blank line between bullets and the next paragraph to add spacing.

 **Verify in your current UI:** the same symbols work in the slide editor and in the AI Assistant chat. Use them either place.

What's next

The next activity covers report settings: name, style, logos, and page numbers.

Create deck → Add manually → Add with AI → Edit & finalise → Format text → **Settings**

Configure your report settings

Activity · Slide Decks · ~10 min

BEFORE YOU START

- ☐ Your slide deck has at least one finalised content slide
- ☐ You have the deck open and can see the **Settings** panel in the report view

WHY IT MATTERS

Settings is where a working draft becomes a shareable report. A clear name, consistent style, the right logos, and page numbers turn a private deck into something a colleague or partner can open without questions.

What to set

Open the **Settings** panel and walk through these five sections in order.

1 General

Update the report name. Use the convention your team agreed on (country, period, topic, your name).

2 Style

Pick the slide colour and adjust background details. Stay with one option across the whole deck.

3 Logos

Add the logos your audience expects to see on the slide. Use the assets that were uploaded to the project.

4 Page details

Turn on page numbers if the deck will be printed or shared as a PDF.

5 Save

Always save before leaving the panel. Settings do not autosave the way slide content does.

Checkpoint

When you close the Settings panel, your deck should:

- Have a clear name your team can find again
- Use one consistent colour scheme across all slides
- Show the expected logos
- Show page numbers if the deck will be printed or shared as a PDF

Delete report

Settings also holds the **Delete Report** button. Use it to remove drafts or test decks from a project. Deletion cannot be undone, so check the report name twice before confirming.

What could go wrong

- **Changes are not on the slide** — you forgot to save. Reopen Settings and confirm.
- **Logos missing** — the logo files were not uploaded to the project assets. Add them in Assets, then return to Settings.

 **Verify in your current UI:** the Settings panel layout may differ slightly. The sections above apply regardless.

What's next

The deck is now ready to share. The next module covers exporting and dissemination.
