

# In-Country Working Session: FASTR Implementation & RMNCAH-N Service Monitoring Analysis

---

January 27-30, 2026 | Lusaka

*GFF FASTR Team*

# Agenda

## Day 1 -- Laying the Foundation: Introducing FASTR and Configuring the Analytics Platform

| Time                                                           | Agenda                                       | Facilitator/Presenter |
|----------------------------------------------------------------|----------------------------------------------|-----------------------|
| <b>Opening Session</b>                                         |                                              |                       |
| 08:30-09:00                                                    | Participant registration                     | MoH team              |
| 09:00-09:10                                                    | Welcome and opening remarks                  | MoH team              |
| 09:10-09:20                                                    | Icebreakers/Introductions                    | MoH team              |
| 09:20-09:35                                                    | Overview of agenda, workshop objectives      | GFF FASTR team        |
| <b>Session 1: Overview of the FASTR approach</b>               |                                              |                       |
| 09:35-10:30                                                    | Overview: FASTR Approaches                   | GFF FASTR team        |
| <b>Session 2: HMIS data extraction</b>                         |                                              |                       |
| 10:30-11:30                                                    | Data extraction: Rationale and methods       | GFF FASTR team        |
| <b>Session 3: Introduction to the FASTR analytics platform</b> |                                              |                       |
| 11:30-12:30                                                    | Introduction to the FASTR analytics platform | GFF FASTR team        |
| 12:30-14:00                                                    | <i>Lunch Break</i>                           |                       |
| 14:00-14:30                                                    | Getting participants into the platform       | GFF FASTR team        |
| <b>Session 4: Configuring the FASTR analytics platform</b>     |                                              |                       |
| 14:30-16:30                                                    | Configuring the analysis platform            | GFF FASTR team        |

# Agenda

---

## Day 2 -- Building the Analysis: Applying FASTR Methods and Generating Outputs

| Time                                                               | Agenda                                      | Facilitator/Presenter |
|--------------------------------------------------------------------|---------------------------------------------|-----------------------|
| 09:00-09:15                                                        | Overview of Day 2 agenda                    | GFF FASTR team        |
| <b>Session 5: Overview of FASTR methods and analytical outputs</b> |                                             |                       |
| 09:15-10:15                                                        | Data quality, service utilization, coverage | GFF FASTR team        |
| <b>Session 6: Creating a project</b>                               |                                             |                       |
| 10:15-11:15                                                        | Project creation and settings               | GFF FASTR team        |
| <b>Session 7: Creating visualizations</b>                          |                                             |                       |
| 11:15-12:30                                                        | Creating and editing visualizations         | GFF FASTR team        |
| 12:30-14:00                                                        | <i>Lunch Break</i>                          |                       |
| <b>Session 8: Creating reports</b>                                 |                                             |                       |
| 14:30-16:30                                                        | Practice creating and editing reports       | GFF FASTR team        |

# Agenda

## Day 3 -- From Analysis to Action: Interpreting Results and Using FASTR for Decision-Making

| Time                                                 | Agenda                                               | Facilitator/Presenter |
|------------------------------------------------------|------------------------------------------------------|-----------------------|
| 09:00-09:15                                          | Overview of Day 3 agenda                             | GFF FASTR team        |
| <b>Session 8: Interpretation of visualizations</b>   |                                                      |                       |
| 09:15-10:15                                          | Approaches to support interpretation                 | GFF FASTR team        |
| <b>Session 9: Creating a Q4 2025 report</b>          |                                                      |                       |
| 10:15-12:30                                          | Creating short and long reports with country context | GFF FASTR team        |
| 12:30-14:00                                          | <i>Lunch Break</i>                                   |                       |
| <b>Session 9 (cont'd): Creating a Q4 2025 report</b> |                                                      |                       |
| 14:00-15:00                                          | Continue report creation with country context        | GFF FASTR team        |
| <b>Session 10: Presenting reports</b>                |                                                      |                       |
| 14:30-15:30                                          | Present reports, group feedback                      | GFF FASTR team        |

# Agenda

## Day 4 -- Designing the Health Facility Assessment

| Time                                                               | Agenda                                               | Facilitator/Presenter |
|--------------------------------------------------------------------|------------------------------------------------------|-----------------------|
| 09:00-09:15                                                        | Overview of Day 4 agenda                             | GFF FASTR team        |
| <b>Session 12: Overview of FASTR HFA phone survey</b>              |                                                      |                       |
| 09:15-10:15                                                        | HFA overview and questionnaire adaptation guidelines | GFF FASTR team        |
| <b>Session 13: Questionnaire adaptation to the Zambian context</b> |                                                      |                       |
| 10:15-12:30                                                        | Review questionnaire + hands-on adaptation           | GFF FASTR team        |
| 12:30-14:00                                                        | <i>Lunch Break</i>                                   |                       |
| <b>Session 14: Questionnaire adaptation (cont'd)</b>               |                                                      |                       |
| 14:00-15:00                                                        | Continue questionnaire adaptation (in groups)        | GFF FASTR team        |
| <b>Session 15: Discussion: HFA adapted questionnaire</b>           |                                                      |                       |
| 14:30-15:30                                                        | Discuss adapted questionnaire in plenary             | GFF FASTR team        |
| <b>Session 16: Discussion: HFA priorities and data use</b>         |                                                      |                       |
| 15:30-16:30                                                        | HFA priorities and data use case in Zambia           | GFF FASTR team        |
| <b>Session 17: Action planning and wrap-up</b>                     |                                                      |                       |
| 16:30-17:00                                                        | Key messages and wrap-up                             | GFF FASTR team        |

# Workshop Objectives

---

- Prepare MoH for participation in the multi-country workshop
- Strengthen capacity for disruption analysis and data extraction
- Configure the FASTR analytics platform for Zambia
- Produce the first quarterly report
- Adapt the phone survey questionnaire to the Zambian context
- Use data downloader tools for DHIS2

# Scope of Work

---

## | Disruption Analysis Activities

- Data extraction and configuration of analytics platform
- Produce first quarterly report
- Review results and contextualize findings (with relevant program teams)

## | Phone Survey Activities

- Adaptation of questionnaire (with program input)

## | Capacity Building

- Training on data downloader for all with DHIS2 access
- Hybrid format: face-to-face and online

# Expected Outputs

---

- Adapted phone survey questionnaire
- First quarterly report draft
- Trained MoH team on data downloader tools
- Roadmap for participation in Abuja workshop

# Session 1: Overview of the FASTR approach

---

# Introduction to FASTR

The Global Financing Facility (GFF) supports country-led efforts to strengthen the use of timely data for decision-making, with the goal of improving primary healthcare (PHC) performance and RMNCAH-N outcomes.

**Frequent Assessments and Health System Tools for Resilience (FASTR)** is the GFF's rapid-cycle analytics framework for monitoring health system performance using high-frequency data.

FASTR brings together four complementary technical approaches:

1. Routine HMIS data analysis
2. Health facility phone surveys
3. High-frequency household phone surveys
4. Follow-on, problem-driven analyses

# RMNCAH-N service use monitoring

---

Rapid-cycle approaches using routine health management information system (HMIS) data can be used to:

- **Evaluate the quality of HMIS data** both at the national and sub-national levels to help address gaps in quality and completeness
- **Measure monthly changes** in the utilization of critical health services, enabling a rapid response to challenges and the opportunity to gain insights on the progress of reforms
- **Compare service coverage trends** with country targets, facilitating the continuous monitoring of RMNCAH-N progress

## | How does it work?

Through collaboration with Ministries of Health, the GFF assists countries in developing and reviewing regular analyses of HMIS data, focusing on specific priority health service indicators linked to national health care reforms, as well as GFF and World Bank investments.

# Why rapid-cycle analytics?

Routine health information systems are a critical source of data, but they are often underused due to concerns about data quality and long delays between data collection and analysis. Traditional household and facility surveys, while essential, are resource-intensive and infrequent.

FASTR's rapid-cycle analytics address this gap by providing:

- Timely insights aligned with country decision cycles
- Continuous learning rather than one-off assessments
- Direct feedback loops between data, analysis, and action

# Focus of the analysis

---

## | Core indicators

FASTR prioritizes a core set of RMNCAH-N indicators that:

- Represent key service delivery contacts across the continuum of care
- Have relatively high reporting completeness and volumes
- Serve as proxies for broader service delivery performance

*Outpatient consultations are included as a proxy for overall health service use. The indicator set can be expanded to reflect country-specific priorities.*

## | Core data quality metrics

Analysis is anchored in a standardized set of data quality metrics, including:

- Reporting completeness
- Extreme value (outlier) detection
- Consistency across related indicators

*These metrics are summarized into an overall data quality score to support interpretation and comparison across areas.*

# Session 2: HMIS data extraction

---

# Why extract data from DHIS2?

---

## | Data quality adjustment

The FASTR approach focuses on data quality adjustments to expand the analyses countries can do with DHIS2 data and to generate more robust estimates.

The FASTR methodology includes specific approaches to:

- Identify and adjust for outliers
- Adjust for incomplete reporting
- Apply consistent data quality metrics

These adjustments require processing that cannot be done within DHIS2's native analytics.

# Why extract data from DHIS2?

---

## | Analysis complexity

The FASTR approach uses more advanced statistical methods, such as regression analysis, which are not available in DHIS2. While DHIS2 can plot trends over time using raw data, FASTR can go further by:

- Identifying significant increases or decreases in service volume
- Adjusting for data quality issues
- Accounting for expected seasonal variations
- Comparing key periods, such as before and after a reform

The choice between DHIS2 and the FASTR approach should be guided by the specific purpose of your analysis.

# Data format and granularity

---

Data should be downloaded for each **indicator of interest**, at **facility level**, and **monthly** for the **period of interest**.

- Data should be saved in **long format** meaning each row represents a single observation or measurement
- Data should be saved in **.csv format** and can be saved in either a single .csv file or multiple .csv files

## | Why monthly facility level data?

We want to use the most granular data we have access to in order to make more fine tuned assessments for data quality. Using monthly facility level data allows us to conduct the most robust analysis.

## Key variables

---

The data extracted should include the following required elements:

| Element        | Description                    |
|----------------|--------------------------------|
| Org units      | Organizational unit identifier |
| Period         | Time period of the data        |
| Indicator name | Name of the indicator          |
| Total/count    | The aggregated value           |

# How much data?

---

## | Initial FASTR analysis

- Download approximately **five years** of historical data
- Exact period depends on data availability and consistency in indicator definitions

## | Routine update to FASTR analysis

- Download new data covering the most recent months not previously included (usually **three months** for quarterly implementation)
- Include the **three preceding months** as recent data is often subject to changes due to late reporting or data quality adjustments

# Data extraction tools

---

We offer two tools for bulk DHIS2 data extraction:

## **API Script** (Google Colab)

- Input login credentials, specify timeframes, indicators, and administrative levels
- Download data as a .csv file

## **Data Downloader**

- More intuitive, streamlined interface
- Recommended for most users

Both tools enable efficient data extraction, and we provide training resources to support their use.

# DHIS2 Data Downloader

---

The Data Downloader is a desktop application for extracting data from DHIS2.

## Key features:

- Connect to any DHIS2 instance
- Browse and select data elements and indicators
- Download facility-level data in CSV format
- Maintain download history

## Download from GitHub:

<https://github.com/worldbank/DHIS2-Downloader/releases/>

*Facilitator will demonstrate the Data Downloader*

# Data Downloader: Login

---

The screenshot shows a web browser window titled "DHIS2 Downloader". The page has a teal header with the text "FASTR DHIS2 Data Downloader" and navigation links: "Download", "Facility", "Dictionary", and "About". There are also language toggle buttons for "EN" and "FR". The main content area is white and contains a login form titled "Welcome!". The form has three input fields: "DHIS2 URL" with a help icon, "Username", and "Password" with a toggle icon. Below the fields is a blue "Connect" button.

**Welcome!**

View and filter facilities by administrative level and organization unit.

# Data Downloader: Facility map

Visualize facility locations on an interactive map.

# **Session 3: Introduction to the FASTR analytics platform**

---

# Introduction to the FASTR Analytics Platform

---

The FASTR analytics platform is a web-based tool for data quality assessment, adjustment, and analysis of routine health data.

## Key features:

- Upload and analyze data from DHIS2 and other sources
- Built-in statistical methods for data quality adjustment
- User-friendly interface for running analyses
- Flexible visualization and export options

**In this session, we will provide a conceptual walkthrough of the platform and its capabilities.**

# Platform Capabilities

---

Data flows from import through analysis to shareable outputs.

# Country Instance

---

Each country has its own **instance** of the FASTR analytics platform.

An instance contains:

- All registered users and their accounts
- The shared administrative structure (regions, districts, facilities)
- Indicator definitions and data sources
- All projects created for that country

**Think of an instance as your country's dedicated workspace.**

# User Roles and Permissions

---

There are two levels of permissions in the platform:

## Instance-level roles:

- **Instance Administrators** can add users, create projects, assign roles, upload data, import and configure modules, and run analyses

## Project-level roles:

- **Project Editors** can create visualizations, create reports, and download/export results
- **Project Viewers** can view visualizations, view reports, and download/export results

*Administrators are assigned per instance; Editors and Viewers are assigned per project.*

# Projects Within an Instance

---

Each country instance can contain **multiple projects**.

A country may only need one project, or multiple projects can be used for:

- Different versions of analyses
- A demo or playground project
- Separate projects for different teams or programs

## Key questions when setting up:

- Who is the admin?
- Who can edit?
- Who can view?

# Practice: Logging Into the Platform

---

## Steps:

1. Go to your country analytics platform URL
2. Click **Sign up** to create an account
3. Enter your information (you may need to verify your email)
4. After logging in, you will initially see a blank page with no projects
5. You will be added to the group project for today's session

*Facilitator will provide the platform URL and assist with login.*

# Live Demo: Platform Access & Roles

---

In this demo, we will:

- Navigate to the FASTR platform
- Explore user roles: Administrator, Editor, Viewer
- Review user management and permissions
- Understand the workflow for uploading data and making analytical decisions

*Facilitator will demonstrate in the live platform*

# Lunch Break

---

90 minutes

Back at 14:00

# Session 4: Configuring the FASTR analytics platform

---

# Activity: Setting Up Admin Areas

---

In this hands-on session, we will configure:

- Admin areas (regions, districts)
- Facility structure
- Indicator definitions

*Participants will work directly in the platform*

# Activity: Importing Data

---

In this hands-on session, we will:

- Review data format requirements
- Walk through the import process
- Handle validation and error checking

*Participants will import their country's data*

# Activity: Installing and Running Modules

---

In this hands-on session, we will:

- Review available analysis modules
- Install required modules
- Run initial analyses

*Participants will configure and run modules on their data*

# Day 2

---

# Recap

---

On Day 1, we covered:

- The FASTR approach and rapid-cycle analytics methodology
- Data extraction from DHIS2 using the Data Downloader
- Introduction to the FASTR Analytics Platform
- Platform configuration: admin areas, data import, modules

# Day 2 Focus

---

Today we will:

- Explore FASTR methods for data quality and analysis
- Create and configure projects
- Build visualizations
- Generate reports

# **Session 5: Overview of FASTR methods and analytical outputs**

---

# FASTR analytical pipeline

---

The FASTR analysis follows a sequential workflow where each step builds on the previous:

- 1. Assess data quality** - Identify issues with completeness, outliers, and consistency
- 2. Adjust for quality issues** - Apply corrections to improve data reliability
- 3. Analyze adjusted data** - Generate service utilization and coverage estimates

# Data quality assessment - Module 1

---

Evaluating the reliability of routine health information system data

# Rationale for data quality assessment

---

**Challenge:** Routine health facility data may contain quality limitations:

- Reported values may fall outside plausible ranges
- Reporting gaps affect data completeness
- Inconsistencies exist between related indicators

**Implications:** Data quality limitations affect decision-making

- Inaccurate assessments of service delivery trends
- Misidentification of areas requiring intervention
- Suboptimal resource allocation

# Objectives of data quality assessment

---

## Objective 1: Enable analytical adjustment

Systematic data quality assessment supports the application of targeted adjustments, enhancing the utility of HMIS data for evidence-based decision-making.

## Objective 2: Monitor data quality trends

Data quality assessment enables ongoing monitoring to:

- Inform indicator selection based on quality profiles across the HMIS
- Guide targeted data quality interventions and supportive supervision in areas with weaker data quality
- Evaluate the effectiveness of data quality improvement initiatives over time

# Core dimensions of data quality

---

## 1. Completeness

Are health facilities submitting reports consistently?

## 2. Outlier prevalence

Are reported values within plausible ranges?

## 3. Internal consistency

Do related indicators demonstrate expected relationships?

These three dimensions provide a comprehensive assessment of data reliability for analytical purposes.

# Indicator completeness

Indicator completeness measures the extent to which facilities that are supposed to report data on the selected core indicators are in fact doing so.

Higher completeness improves reliability of the data, especially when completeness is stable over time.

This is different from overall reporting completeness in that it looks at completeness of specific data elements and not only at the receipt of the monthly reporting form.

## Region A: Indicator Completeness

5 health facilities reporting monthly on ANC1

5 facilities × 12 months = 60 expected  
48 reported → 80% completeness

# Definition of indicator completeness

---

For the FASTR analysis, completeness is defined as:

**The percentage of reporting facilities each month out of the total number of facilities expected to report.**

- A facility is deemed to be "reporting" if there is a non-missing, non-zero value recorded for the indicator and month
- A facility is expected to report if it has reported any volume for that indicator anytime within a year

## Notes on completeness

---

- A high level of completeness does not necessarily indicate that the HMIS is representative of all service delivery in the country as some services may not be delivered in facilities, or some facilities may not report
- For countries where the DHIS2 system does not store 0's, indicator completeness may be underestimated if there are many low-volume facilities for a given indicator
- Facilities that do not report for six or more consecutive months at the beginning or end of their reporting period are classified as **inactive** rather than incomplete. This prevents penalizing facilities that have not yet begun reporting or have permanently ceased operations

For a given indicator in a given time period, the percent of monthly values that are complete:

$$\% \text{ complete} = \# \text{ monthly values that are complete} / \text{total N of monthly values}$$

## Indicator Completeness

Percentage of facility-months with complete data, Jan 2022 to Apr 2025

|              | Antenatal care 1 | Antenatal care 4 | Institutional delivery | Postnatal care 1 (newborns) | Postnatal care 1 (mothers) | BCG vaccine | Penta vaccine 1 | Penta vaccine 3 | Outpatient visit |

|  |              |
|--|--------------|
|  | 90% or above |
|  | 80% to 89%   |
|  | Below 80%    |

Higher completeness improves the reliability of the data, especially when completeness is stable over time. Completeness is defined as the percentage of reporting facilities each month out of the total number of facilities

# Outliers

---

The presence of outliers examines whether a data point in a series of values is extreme (either abnormally high or low) in relation to others in the series.

Outliers can be the result of changes in programmatic activities (such as an intensified campaign) or can be data quality problems.

For the FASTR analysis, we identify outliers which are suspiciously high values compared to the usual volume of services reported by the facility (e.g., low values are not identified as outliers in the FASTR analysis).

# Outlier illustration

Region A displays an anomalous spike in February that substantially exceeds values reported by other regions — indicative of a data entry error or reporting issue.

*Outliers can distort the true picture of service trends*

# Outlier detection methodology

---

Outliers are identified by assessing the within-facility variation in monthly reporting for each indicator.

An outlier is defined as:

A value greater than **10 times the median absolute deviation (MAD)** from the monthly median value for the indicator in each time period, **OR** a value for which the proportional contribution in volume for a facility, indicator, and time period is **greater than 80%**

**AND** for which:

- The volume is **greater than or equal to the median**
- The volume is **not missing**
- The volume is **greater than 100**

# Outliers: Percent of monthly values that are outliers

For a given indicator in a given time period, the percent of monthly values that are outliers:

$$\% \text{ outliers} = \# \text{ monthly values that are outliers} / \text{total N of monthly values}$$

## Outliers

Percentage of facility-months that are outliers, May 2024 to Apr 2025

|            | Antenatal care 1 | Antenatal care 4 | Institutional delivery | Postnatal care 1 (newborns) | Postnatal care 1 (mothers) | BCG vaccine | Penta vaccine 1 | Penta vaccine 3 | Outpatient visit |
|------------|------------------|------------------|------------------------|-----------------------------|----------------------------|-------------|-----------------|-----------------|------------------|
| Region 001 | 0.6%             | 0.2%             | 0.2%                   | 1.9%                        | 1.2%                       | 0.6%        | 0.9%            | 0.6%            | 0.9%             |
| Region 002 | 0.6%             | 0.0%             | 1.2%                   | 1.0%                        | 1.8%                       | 0.2%        | 0.2%            | 0.1%            | 2.7%             |
| Region 003 | 0.5%             | 0.4%             | 0.1%                   | 0.0%                        | 0.1%                       | 0.1%        | 0.4%            | 0.6%            | 1.4%             |
| Region 004 | 0.4%             | 0.0%             | 0.0%                   | 0.8%                        | 0.0%                       | 0.5%        | 0.8%            | 0.9%            | 0.1%             |

| Region 006 | 0.4%             | 0.0%             | 0.1%                   | 0.3%                        | 0.1%                       | 1.3%        | 2.3%            | 2.5%            | 0.6%             |

- 3% or above
- 1% to 2%
- Below 1%

Outliers are reports which are suspiciously high compared to the usual volume reported by the facility in other months. Outliers are identified by assessing the within-facility variation in monthly reporting for each indicator. Outliers are defined observations which are greater than 10 times the median absolute deviation (MAD) from the monthly median value for the indicator in each time period, OR a value for which the proportional contribution in volume for a facility, indicator, and time period is greater than 80%. Outliers are only identified for indicators where the volume is greater than or equal to the median, the volume is not missing, and the average volume is greater than 100.

## Consistency between related indicators

---

Program indicators with a predictable relationship are examined to determine whether the expected relationship exists between them. In other words, this process examines whether the observed relationship between the indicators, as shown in the reported data, is that which is expected.

# Indicator pairs assessed

---

FASTR assesses the following pairs of indicators to measure internal consistency:

| Indicator pair          | Expected relationship                                        |
|-------------------------|--------------------------------------------------------------|
| ANC1 / ANC4             | Ratio should be $\geq 0.95$                                  |
| Penta1 / Penta3         | Ratio should be $\geq 0.95$                                  |
| BCG / Facility delivery | Ratio should be within 30% (i.e. $\geq 0.7$ and $\leq 1.3$ ) |

These pairs of indicators have expected relationships.

We expect the number of pregnant women receiving a first ANC visit will always be higher than the number of pregnant women receiving a fourth ANC visit.

BCG is a birth dose vaccine so we expect that these indicators will be equal. However, we recognize there may be more variability in this predicted relationship thus we set a range of within 30%.

# Why assess consistency at district level?

Patients often access different services at different facilities within a district:

- A woman may attend **ANC1** at a nearby health post, but travel to a health centre for **ANC4**
- A child may receive **Penta1** at a local clinic, but complete **Penta3** at a district hospital

Checking consistency at the facility level would miss these patterns. Aggregating to district level captures the complete picture of service utilization within a geographic area.

# Internal consistency: FASTR output

## Internal consistency

Percentage of sub-national areas meeting consistency benchmarks, May 2024 to Apr 2025

|            | ANC1 is larger than ANC4 | Delivery is approximately equal to BCG | Penta1 is larger than Penta3 |
|------------|--------------------------|----------------------------------------|------------------------------|
| Region 001 | 100.0%                   | 0.0%                                   | 97.2%                        |
| Region 002 | 100.0%                   | 0.0%                                   | 100.0%                       |
| Region 003 | 100.0%                   | 45.8%                                  | 83.3%                        |
| Region 004 | 100.0%                   | 37.5%                                  | 87.5%                        |
| Region 005 | 100.0%                   | 0.0%                                   | 87.5%                        |
| Region 006 | 100.0%                   | 49.0%                                  | 84.4%                        |

|  |              |
|--|--------------|
|  | 90% or above |
|  | 80% to 89%   |
|  | Below 80%    |

Internal consistency assesses the plausibility of reported data based on related indicators. Consistency metrics are approximate - depending on timing and seasonality, indicator definitions, and the nature of service delivery and reporting, values may be expected to sit outside plausible ranges. Indicators which are similar are expected to have roughly the same volume over the year (within a 30% margin). The data in this analysis is adjusted for outliers.

## Data quality summary score

---

A composite measure of data quality provides an overall view of how well a dataset meets quality standards.

By integrating multiple dimensions of data quality into a single score, it simplifies the interpretation of detailed information from several measures. This allows health systems to quickly assess the reliability of data, making it easier to identify trends and issues at a glance.

## Definition of adequate data quality

---

For the FASTR analysis, we defined adequate data quality as:

- No missing indicator data for OPD, Penta1, and ANC1, where available, **AND**
- No outliers for OPD, Penta1, and ANC1, where available, **AND**
- Consistent reporting between Penta1/Penta3 and ANC1/ANC4

# Overall DQA score: Percent of monthly values meeting all criteria

For a given indicator in a given time period, the percent of monthly values meeting all DQA criteria:

$$\% \text{ adequate quality} = \# \text{ monthly values meeting all criteria} / \text{total N of monthly values}$$

## Overall DQA score

Percentage of facility-months with adequate data quality over time

|            | 2022  | 2023  | 2024  | 2025  |
|------------|-------|-------|-------|-------|
| Region 001 | 60.8% | 76.6% | 76.4% | 84.4% |
| Region 002 | 55.3% | 61.2% | 58.2% | 52.0% |
| Region 003 | 69.3% | 73.4% | 60.6% | 47.0% |
| Region 004 | 54.6% | 70.7% | 70.0% | 84.9% |
| Region 005 | 57.9% | 69.5% | 56.6% | 55.4% |
| Region 006 | 74.0% | 84.7% | 72.2% | 71.7% |

80% or above

70% to 79%

Below 70%

Adequate data quality is defined as: 1) No missing data or outliers for OPD, Penta1, and ANC1, where available 2) Consistent reporting between Penta1/Penta3 and ANC1/ANC4.

# Mean DQA score: How close are we to adequate quality?

The mean DQA score shows how close a facility's data is to meeting all quality criteria. A score of **100% means the data passes** all DQA checks—no missing values, no outliers, and consistent reporting.

**Mean DQA = (completeness & outlier score + consistency score) / 2**

Lower scores indicate more data quality issues that need attention before the data can be used with confidence.

## Mean DQA score

Average data quality score across facility-months

|            | 2022  | 2023  | 2024  | 2025  |
|------------|-------|-------|-------|-------|
| Region 001 | 90.2% | 95.5% | 95.5% | 96.5% |
| Region 002 | 87.3% | 89.0% | 88.2% | 85.6% |
| Region 003 | 92.8% | 94.8% | 91.0% | 84.3% |
| Region 004 | 88.0% | 93.9% | 93.0% | 97.0% |
| Region 005 | 89.5% | 93.6% | 91.1% | 88.6% |
| Region 006 | 93.2% | 96.3% | 93.4% | 93.4% |

Items included in the DQA score include: No missing data for 1) OPD, 2) Penta1, and 3) ANC1, where available; No outliers for 4) OPD, 5) Penta1, and 6) ANC1, where available; Consistent reporting between 7) Penta1/Penta3, 8) ANC1/ANC4, 9)BCG/Delivery, where available.

# DQA module: Configuration parameters

---

| Parameter                                         | Description                                                                                                                                                                 |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Proportion threshold for outlier detection</b> | Adjusts the threshold for proportional contribution to flag a facility-month as an outlier                                                                                  |
| <b>Minimum count threshold for consideration</b>  | Defines the minimum count required for a facility-month to be considered an outlier                                                                                         |
| <b>Number of MADs</b>                             | Outliers are defined as observations which are greater than X times the median absolute deviation (MAD) from the monthly median value for the indicator in each time period |
| <b>Indicators subjected to DQA</b>                | Defines which indicators are included for assessment of outliers and completeness for inclusion in the DQA score                                                            |
| <b>Consistency pairs used</b>                     | Defines which indicator pairs are used for consistency analysis and the expected ratio ranges                                                                               |

# Data quality adjustment - Module 2

---

Correcting outliers and imputing missing values to improve data reliability

# Rationale for data quality adjustment

---

Routine HMIS data contain two common limitations that can distort analytical results:

| Issue                | Impact on analysis                                                                   |
|----------------------|--------------------------------------------------------------------------------------|
| Outliers             | Extreme values create artificial spikes in service volumes                           |
| Incomplete reporting | Missing data creates artificial declines that do not reflect actual service delivery |

FASTR addresses these limitations by replacing problematic values with estimates derived from each facility's historical reporting patterns.

# Adjustment scenarios

---

To support transparency and sensitivity analysis, FASTR produces four parallel datasets:

| Scenario              | Description              |
|-----------------------|--------------------------|
| Unadjusted            | Original reported values |
| Outliers adjusted     | Extreme values replaced  |
| Completeness adjusted | Missing values imputed   |
| Both adjusted         | All corrections applied  |

# Indicators excluded from adjustment

---

Certain indicators are excluded from the adjustment process:

- **Mortality indicators** (maternal deaths, neonatal deaths, under-5 deaths): These represent discrete events where smoothing or imputation is not appropriate
- **Low-volume indicators**: Indicators that never exceed 100 reported events in any month are excluded from adjustment

# Outlier adjustment methodology

---

Outlier values are replaced using facility-specific historical data. The adjustment follows a hierarchical approach:

| Priority | Method                    | Application                                                       |
|----------|---------------------------|-------------------------------------------------------------------|
| 1        | Centered 6-month average  | 3 months before + 3 months after the outlier                      |
| 2        | Forward 6-month average   | When insufficient preceding data (e.g., start of series)          |
| 3        | Backward 6-month average  | When insufficient following data (e.g., end of series)            |
| 4        | Same month, previous year | When rolling averages unavailable; useful for seasonal indicators |
| 5        | Facility historical mean  | Mean of all valid values for this indicator at this facility      |

## Deviance Due to Outliers

Percent change in volume due to outlier adjustment, Oct 2024 to Sep 2025

|                             | Antenatal<br>client 1st visit | Antenatal<br>client 4th visit | Institutional<br>delivery<br>(normal,<br>assisted, and<br>csection) | Postnatal<br>care 1<br>(newborns) | Postnatal<br>care 1<br>(mothers) | BCG dose | Pentavalent<br>1st dose | Pentavalent<br>3rd dose | Family<br>planning<br>methods-<br>long acting | Family<br>planning<br>methods-<br>short acting | Fever case<br>tested<br>positive for<br>malaria (RDT<br>and<br>microscopy) | Malaria<br>treated with<br>ACT |

Outliers are reports which are suspiciously high compared to the usual volume reported by the facility in other months. Outliers are identified by assessing the within-facility variation in monthly reporting for each indicator. Outliers are defined observations which are greater than 10 times the median absolute deviation (MAD) from the monthly median value for the indicator in each time period, OR a value for which the proportional contribution in volume for a facility, indicator, and time period is greater than 80%. Outliers are only identified for indicators where the volume is greater than or equal to the median, the volume is not missing, and the average volume is greater than 100. The deviance is the difference in volume after removing the outlier. High levels of deviance can affect the plausibility of the data.

# Completeness adjustment methodology

---

For months identified as incomplete or missing, values are imputed using the same 6-month rolling average approach applied to outlier adjustment.

| Priority | Method                   | Application                                                  |
|----------|--------------------------|--------------------------------------------------------------|
| 1        | Centered 6-month average | When sufficient data exists before and after the gap         |
| 2        | Forward 6-month average  | For gaps at the start of the time series                     |
| 3        | Backward 6-month average | For gaps at the end of the time series                       |
| 4        | Facility historical mean | Mean of all valid values for this indicator at this facility |

This approach prevents temporary reporting gaps from creating artificial declines in service volumes.

## Deviance Due to Incompleteness

Percent change in volume due to completeness adjustment, Oct 2024 to Sep 2025

Completeness is defined as the percentage of reporting facilities each month out of the total number of facilities expected to report. A facility is expected to report if it has reported any volume for each indicator anytime within a year. The deviance is the difference in volume after imputing incomplete data. High levels of deviance can affect the plausibility of the data.

When both adjustments are applied, outliers are corrected first, then missing values are imputed using the cleaned data.

| Deviance Due to Incompleteness and Outliers                                                    |                            |                            |                                                         |                             |                            |          |                      |                      |                                     |                                      |                                                             |                          |

# Service utilization analysis - Module 3

---

Detecting and quantifying changes in health service delivery over time

# Objectives

---

## 1. Measure changes in service volume

Year-over-year comparison of service volumes identifies increases or decreases across regions and indicators.

## 2. Detect and quantify disruptions

Statistical comparison of observed volumes against expected levels—derived from historical trends and seasonal patterns—enables identification and quantification of service shortfalls or surpluses.

# Year-over-year change

---

**Year-over-year percent change** quantifies shifts in service delivery between consecutive years.

For each indicator and region, total volume in the current year is compared to the previous year:

**Percent change** =  $(\text{Current year} - \text{Previous year}) \div \text{Previous year} \times 100$

Changes exceeding **±10%** are flagged for review.

# Output: Change in service volume

## Service volume by year & year-on-year change

Janv 2019 à Sept 2025

Augmentation de plus de 10% d'un trimestre à l'autre  
Diminution de plus de 10% d'un trimestre à l'autre  
Volume annuel ajusté pour les valeurs aberrantes.

# Interpretation

---

| Element     | Description                       |
|-------------|-----------------------------------|
| Bars        | Annual service volumes by region  |
| Percentages | Year-over-year change annotations |

## Key considerations:

- Which regions exhibit the largest changes?
- Are changes consistent across regions or geographically concentrated?
- Do patterns vary by indicator?

# Disruption detection

---

Our approach to service disruptions and surpluses utilizes an interrupted time series regression with facility-level fixed effects. Previous large and unexpected changes in historical data are removed. Unexpected volume changes are estimated by comparing observed volume to expected volume based on historical trends and seasonality.

# Disruptions and surpluses

**Disruptions** are flagged when volumes fall below anticipated levels, signaling potential barriers to access, resource shortages, or system failures.

**Surpluses** occur when volumes exceed expectations, which may indicate increased demand, over-reporting, or changes in service delivery.

## Perturbations et excédents du volume de service, au niveau national

■ Perturbation

Ce graphique quantifie les variations au niveau du volume de services, par rapport aux tendances historiques, en tenant compte de la saisonnalité. Ces signaux doivent être triangulés avec d'autres données et connaissances contextuelles, pour déterminer s'ils résultent d'une qualité de données inadéquate. Les variations inattendues de volume sont estimées en comparant le volume observé au volume attendu, selon les tendances historiques et la saisonnalité. Les variations inattendues importantes dans les données historiques sont exclues. Cette analyse repose sur une régression de séries chronologiques interrompues avec effets fixes au niveau des établissements.

# How it works

---

**Using past data to set expectations:** We look at the past few years of data to understand the typical pattern for each month, accounting for regular seasonal changes.

**Spotting unusual changes:** We compare current service volumes to expectations. If we see volumes much higher or lower than expected, we flag it as an unusual change.

**Handling past disruptions:** We adjust historical data by removing previous big, unexpected changes so one-off events don't skew our understanding of what's "normal."

**Detecting disruptions over time:** We look at trends to see if there are clear shifts in health service use over several months.

# Comparison to DHIS2

---

Extension of service utilization analysis, using more complex statistical approaches not available in DHIS2.

Using a regression framework, we are able to:

- Account for seasonality
- Exclude unusual changes to ensure one-off events aren't influencing normal trends
- Use historical data as a baseline for context
- Detect disruptions and recovery patterns
- Quantify changes with a robust methodology as compared to just observing simple fluctuations in a trend line

This improves the ability to interpret and compare utilization data across national and sub-national areas without needing population denominators.

# Service utilization module: Configuration parameters

---

| Parameter                               | Description                                                                                                             |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Count variable to use for modeling      | Which adjusted count to use for calculating expected values                                                             |
| Count variable to use for visualization | Which adjusted count to use as actual observed values                                                                   |
| Run district-level model                | Run regressions at admin_area_3 level. Set to Yes for detailed analysis, No for faster runtime                          |
| Run admin_area_4 analysis               | Run finest-level analysis. Warning: can be very slow for large datasets                                                 |
| Threshold for MAD-based control limits  | Number of MADs to flag sharp deviations. Default 1.5; higher = less sensitive                                           |
| Smoothing window (k)                    | Window size in months for rolling median smoothing. Must be odd. Default 7                                              |
| Dip threshold                           | Flag if actual falls below this proportion of expected. Default 0.9 ( $\geq 10\%$ drop); use 0.8 to flag only big drops |
| Difference percent threshold            | Highlight points where actual differs from expected by more than this percent. Default 10                               |

## Service coverage estimates - Module 4

---

Estimating the percentage of the target population that received a given health service

# Our approach to service coverage analysis

---

Our approach derives and validates population denominators, significantly improving coverage estimates reported from HMIS systems.

In countries with accurate data, this approach helps identify subnational inequities and updates outdated estimates, while in countries with less precise data, the trends still provide valuable insights into performance.

We use these estimates to track recent trends and subnational disparities in the coverage of selected health services.

## Two-part analytical process

---

The coverage estimation module operates in two sequential parts:

| Part                                   | Components                                                                                                                            |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Part 1: Denominator calculation</b> | Calculate target populations using multiple methods; compare against survey benchmarks; select optimal denominator for each indicator |
| <b>Part 2: Coverage estimation</b>     | Apply denominator selections; project survey estimates forward using HMIS trends; generate final coverage estimates                   |

# What is service coverage?

---

**Service coverage** represents the proportion of the target population that received a specified health service.

$$\text{Service coverage} = \frac{\text{Population who received the service}}{\text{Population who need the service (target population)}}$$

Numerator comes from DHIS2 data, count of services adjusted for outliers

Several options for estimating the denominator

## Denominators by service type

---

Each health indicator corresponds to a specific target population:

| Service                | Target population (denominator)          |
|------------------------|------------------------------------------|
| ANC1, ANC4             | Pregnant women                           |
| Institutional delivery | Live births                              |
| BCG                    | Live births                              |
| Penta1, Penta3         | Infants surviving beyond neonatal period |
| Measles1, Measles2     | Infants surviving beyond infancy         |

# Demographic cascade

Sequential demographic adjustments transform one target population estimate into another. Starting from pregnancies, demographic factors are applied to derive subsequent denominators:

## Default values:

Pregnancy loss rate = 0.03 | Twin rate = 0.015 | Stillbirth rate = 0.02 | NMR = 0.03 | PNMR = 0.02

Use country-specific values for stillbirth rate, NMR, PNMR, and IMR when available from DHS/MICS.

# Denominator cascade: Illustration

Starting from ANC1 service counts, demographic adjustment factors are applied sequentially to derive denominators for other services:

## Example: Calculating denominators from ANC1 visits

### Calculation summary:

Step 1: Pregnancies = ANC1 visits ÷ ANC1 coverage = 10,000 ÷ 0.87 = 11,494

Step 2: Apply demographic factors through the cascade:

Pregnancies (11,494) → Deliveries (11,149) → Births (11,316) → Live Births (11,090) → DPT-eligible (10,757) → Measles-eligible (10,542)

Rates: Pregnancy loss = 3%, Twin rate = 1.5%, Stillbirth = 2%, NMR = 3%, PNMR = 2%

# Forward and backward derivation

---

From any entry point, the cascade derives denominators in both directions:

| Direction | Method                                    | Example from Penta1                                            |
|-----------|-------------------------------------------|----------------------------------------------------------------|
| Forward   | Apply mortality/attrition rates           | DPT-eligible → Measles1-eligible → Measles2-eligible           |
| Backward  | Reverse mortality rates (add deaths back) | DPT-eligible → Live births → Births → Deliveries → Pregnancies |

Backward derivation enables estimation of upstream populations from downstream service counts.

# Denominators by entry point

Each HMIS indicator serves as an entry point. The module derives all target populations via forward and backward cascades:

| Entry point       | Base calculation                   | Forward derivation                                         | Backward derivation                             |
|-------------------|------------------------------------|------------------------------------------------------------|-------------------------------------------------|
| <b>ANC1</b>       | ANC1 ÷ coverage → Pregnancies      | Deliveries → Live births → DPT-eligible → Measles-eligible | —                                               |
| <b>Deliveries</b> | Deliveries ÷ coverage → Deliveries | Live births → DPT-eligible → Measles-eligible              | Pregnancies                                     |
| <b>BCG</b>        | BCG ÷ coverage → Live births       | DPT-eligible → Measles-eligible                            | Deliveries → Pregnancies                        |
| <b>Penta1</b>     | Penta1 ÷ coverage → DPT-eligible   | Measles1-eligible → Measles2-eligible                      | Live births → Births → Deliveries → Pregnancies |

# Automatic denominator selection

---

For each indicator, the module selects the denominator that produces coverage closest to the survey benchmark.

## Selection algorithm:

1. Calculate coverage using each denominator option
2. Calculate squared error against survey:  $(coverage - survey)^2$
3. Apply selection hierarchy (HMIS-based denominators prioritized over UN WPP)
4. Select the HMIS-based denominator with minimum error

Selection is made per indicator and geographic area. Users may override automatic selections in Part 2.

# Coverage projection methodology

The module projects the most recent survey value forward using trends observed in HMIS-derived coverage:

Year-over-year changes (deltas) in HMIS coverage are calculated and applied to the last survey value. This approach preserves the survey baseline while incorporating observed service delivery trends.

# Interpretation of coverage outputs

---

| Element                  | Description                                                      |
|--------------------------|------------------------------------------------------------------|
| <b>Black line/points</b> | Survey data (DHS/MICS) — household survey reference              |
| <b>Grey line/points</b>  | HMIS-based coverage from facility data                           |
| <b>Red line/points</b>   | Projected coverage — survey estimates extended using HMIS trends |

# Coverage module: Configuration parameters

---

| Parameter                       | Description                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------|
| Count value to use              | Which adjusted count to use for coverage calculation                                                       |
| Level to calculate coverage for | Geographic levels for coverage estimation: national, provincial (admin area 2), or district (admin area 3) |
| Pregnancy loss rate             | Proportion of pregnancies ending in loss before delivery                                                   |
| Twin rate                       | Proportion of deliveries resulting in twins                                                                |
| Stillbirth rate                 | Proportion of births that are stillbirths                                                                  |
| Neonatal mortality rate         | Deaths in first 28 days per live birth                                                                     |
| Postneonatal mortality rate     | Deaths from 28 days to 1 year per live birth                                                               |
| Infant mortality rate           | Deaths before age 1 per live birth                                                                         |
| Under 5 mortality rate          | Deaths before age 5 per live birth                                                                         |

Country-specific mortality rates may be obtained from DHS reports, UN IGME, or national vital statistics.

# Session 6: Creating a project

---

# Activity: Creating a Project

---

In this hands-on session, we will:

- Set up a new project
- Configure project settings
- Select indicators and time periods
- Apply best practices for project organization

*Participants will create their first project*

# Session 7: Creating visualizations

---

# Activity: Creating Visualizations

---

In this hands-on session, we will:

- Explore available chart types
- Create and customize visualizations
- Export charts for use in reports

*Participants will build visualizations from their analysis*

# Lunch Break

---

90 minutes

Back at 14:00

# Session 8: Creating reports

---

# Activity: Creating Reports

---

In this hands-on session, we will:

- Use report templates
- Generate automated reports
- Customize report content and layout

*Participants will create their first quarterly report draft*

# Day 3

---

# Recap

---

On Day 2, we covered:

- FASTR methods for data quality assessment and adjustment
- Creating and configuring projects in the platform
- Building visualizations from Zambia data
- Generating reports

# Day 3 Focus

---

Today we move from analysis to action:

- Deep dive into interpretation of results
- Create the Q4 2025 quarterly report
- Present findings to the group
- Develop action plans for continued work

# Session 8: Interpretation of visualizations

---

# Analytical thinking & interpretation

---

*Content to be developed*

This section will cover:

- Frameworks for interpreting FASTR outputs
- Connecting data patterns to programmatic meaning
- Common interpretation pitfalls to avoid
- Building analytical thinking skills

# Session 9: Creating a Q4 2025 report

---

# Generating quarterly reporting products

---

*Content to be developed*

This section will cover:

- Quarterly reporting workflow
- Using the FASTR platform for automated reports
- Quality assurance for reports
- Distribution and feedback mechanisms

# Lunch Break

---

90 minutes

Back at 14:00

# Session 10: Presenting reports

---

# End user mapping

---

End user mapping helps ensure that our outputs will meet the real needs of our end users.

## | Key questions

1. Who is my end user?
2. What does this end user need to accomplish with the report?
3. What information are they most interested in?
4. What do they like/not like about current reports?
5. How do they like to receive their information?

# Day 4

---

# Recap

---

On Day 3, we covered:

- Interpretation of FASTR visualizations
- Creation of the Q4 2025 quarterly report
- Presentation of findings and group feedback
- Action planning for continued platform use

# Day 4 Focus

---

Today we design the Health Facility Assessment:

- Overview of the FASTR HFA phone survey
- Review questionnaire structure
- Adapt questionnaire for Zambia context
- Plan HFA priorities and data use

# **Session 12: Overview of FASTR HFA phone survey**

# Lunch Break

---

90 minutes

Back at 14:00

# Next Steps & Action Planning

---

Key actions to take after this working session:

- Finalize adapted phone survey questionnaire
- Complete first quarterly report draft
- Train remaining MoH team on data downloader tools
- Prepare roadmap for participation in Abuja workshop

# Quarterly Reporting Cycle

---

Establish a sustainable reporting rhythm:

- Define quarterly report timeline and responsibilities
- Set up data extraction schedule
- Establish review and approval process
- Plan dissemination to stakeholders

# Continued Platform Usage

---

Maintain momentum with the FASTR platform:

- Regular data updates and quality checks
- Expanding analysis to additional indicators
- Building capacity across MoH teams
- Documentation of lessons learned

# Workshop Closing

---

Thank you for your participation!

Over the past four days, we have:

- Configured the FASTR platform for Zambia
- Created the first quarterly RMNCAH-N report
- Adapted the HFA questionnaire for local context
- Built capacity for ongoing analysis and reporting

# Stay Connected

---

Continue the journey:

- Platform access and support
- Quarterly report submissions
- Multi-country workshop in Abuja
- Ongoing technical assistance from GFF team

# Thank You

---

FASTR Working Session - Zambia  
January 27-30, 2026  
Lusaka
