

Facilitator guide — Disruption Report

Facilitator guide · Disruption Report · 4 activities · ~180–240 min

Purpose

This is the capstone of the analysis activities. Teams produce a complete disruption report with the AI Assistant, then verify, refine, and peer-review it. It draws together everything earlier in the workshop — building a report by hand, prompting, and verification — and applies it to a real deliverable. The module assumes participants have already done the manual report build and the prompting activity; if they have not, slow down at the prompt step.

By the end, each team should have a verified, refined disruption report they could present to a decision-maker, and a clear sense of what the AI drafted versus what the team is accountable for.

Session at a glance

#	Activity	Time	Format
1	Create the report with the AI	~60 min	Team (one driver)
2	Verify the output	~20 min	Team
3	Refine	~40 min	Team
4	Peer review and present	~40 min	Team ↔ team

Running the session

Preparation. Confirm each team has a loaded instance and has completed the prompting and manual-report activities. Have the Prompt library open in the demo account so you can show the first run live. This is the longest activity in the workshop — plan for 3–4 hours and protect it from being squeezed.

How to demonstrate. Demonstrate the first prompt run before teams start: open the Prompt library, run Prompt 1, and answer the AI's questions on screen. Then let teams work. Generation takes 5–10 minutes per build, so build the verify-checklist discussion into that waiting time rather than letting the room go idle.

Grouping. Teams work in small groups with one **driver** at the keyboard and everyone else reviewing. Rotate the driver between sections if time allows, so more than one person practices the prompts.

Pacing. Activity 1 (generation) sets up everything else; do not rush the groupings step within it. If the session runs long, compress activity 3 (refine) rather than activity 2 (verify) — an unverified report is worse than a less-polished one.

The message to carry through. The AI drafts; the team is accountable. Reinforce verification at every step, not only in activity 2.

The activities

1. Create the report with the AI · ~60 min · team

What happens. Teams generate the core report from a ready-made prompt (Prompt 1 national, or Prompt 4 subnational): create the deck → open the AI Assistant → pick the prompt → answer its questions (period, subtitle, groupings, mortality) → review groupings → confirm → let it build.

Demonstrate. Run Prompt 1 on screen and answer the AI's questions, pausing on the **groupings** step — show what a thoughtful grouping looks like, because this is what determines whether the report reads cleanly.

Say something like. *"Once it starts building, don't click a slide — it interrupts the build. Take your time on groupings; a rushed grouping gives you a messy report."*

What a good result looks like. A complete report built from a deliberate set of groupings, with the driver entering agreed answers rather than the whole group typing at once.

Watch for.

- Teams clicking a slide mid-generation — tell them to wait.
- Rushed groupings — spend real time here.
- The whole group talking over the driver — one person types the agreed answers.

2. Verify the output · ~20 min · team

What happens. A two-part checklist the whole team works before the report is used: general checks (all slides present, country, period, no leftover placeholders) and report checks (groupings correct, charts loading, interpretations match the charts, titles are findings).

Demonstrate. Show one interpretation read aloud against its chart — model checking the words against the line, not the tone of the writing.

Say something like. *"Read each interpretation aloud and look at the chart while you do. If the words say 'sharp drop' and the line barely moves, fix the words."*

What a good result looks like. Every slide checked, with mismatches between text and chart caught and noted for the refine step.

Watch for.

- Teams trusting the AI because it sounds confident — make them read interpretations aloud and check against the chart.

3. Refine · ~40 min · team

What happens. Formatting plus optional extra sections via Prompt 2 (regional) and Prompt 3 (data quality): polish for the audience, append the regional and/or DQA sections, and check each new section as it is added.

Demonstrate. Show appending one section with Prompt 2 or 3, then immediately verifying it — reinforcing that every new section gets the same check as the base report.

Say something like. *"Add only what a decision-maker needs. More sections is not a better report — it's a longer one."*

What a good result looks like. A report polished for its audience, with only the extra sections that serve the decision, each verified.

Watch for.

- Teams adding every section "to be safe" — steer them to what the audience actually needs.

4. Peer review and present · ~40 min · team team

What happens. Teams swap reports, review as a fresh reader, and present feedback: read cold (is the message clear? would a decision-maker act?), note two strengths and two suggestions, present back, then group discussion.

Demonstrate. Model one piece of useful feedback versus one vague piece, so teams aim for specific, slide-anchored suggestions.

Say something like. *"Tie each suggestion to a specific slide. 'Slide 3's title isn't a finding' helps; 'make it clearer' doesn't."*

What a good result looks like. Each team gives another two concrete strengths and two actionable, slide-specific suggestions.

Watch for.

- Vague feedback — push for specific suggestions tied to a slide.

Closing the session

This report is the workshop's main deliverable. Close by reinforcing the division of labour that produced it: the AI drafted quickly, and the team's verification and local knowledge are what make it trustworthy enough to present.
