

Let the AI draft the interpretation

Activity · Visualizations & Interpretation · ~15 min

BEFORE YOU START

- You have a chart on a slide (from the previous activity)
- You've written one interpretation by hand — so you know what "good" looks like
- You have the *Reading a viz* reference handout next to you

WHY IT MATTERS

The AI's text is a **draft**, not a final answer. **You are responsible** for what gets put on the slide.

What you'll do

Use the AI Assistant to draft an interpretation for your chart — then verify and refine what it gives you. Same end result as writing by hand, but faster as a starting point.

How this works

The AI looks at your chart, reads the underlying data, and proposes text. It handles the **describing** — you handle the **explaining** and the verification.

1 Ask the AI for an interpretation

In the slide editor, open the AI chat and type:

"Write an interpretation for this chart. Cover what you see and what it means for service delivery."

The AI reads the data behind the chart and proposes a title + 2–3 sentences.

2 Verify what the AI gave you

Read it slowly. For every claim the AI makes, ask:

- ☐ Is this **actually visible in the chart**? (No hallucinations.)
- ☐ Are the **numbers right**? Compare against the chart's values directly.
- ☐ Is the **so-what realistic** for your country context?
- ☐ Does the **title carry the message**, or is it just a label?

3 Refine in plain language

If something is wrong or vague, **say so**:

- *"The drop you mentioned isn't in the chart — please re-check."*
- *"Reframe the so-what for a director of PHC, not a data manager."*
- *"Make the title a finding, not a description."*

The AI rewrites. Iterate until the output passes your verification.

4 Add your local context

The AI doesn't know what's happening on the ground. Add:

- **Local events** (a strike, a stockout, a recent campaign)
- **Programmatic nuance** (is this a real problem or an artefact?)
- **Recommendations** rooted in what your country team knows

Pitfalls to avoid

- **Trusting the AI without checking.** It can sound confident and still be wrong. Verify every claim against the chart.
- **Skipping the local context.** A generic interpretation feels generic. Yours should reflect what *your country team* would say in a room.
- **Letting the AI write the action.** The action belongs to you — the AI can't know who the decision-maker is or what's politically feasible.

What's next

The final handout in this series puts it all together — **spotting a disruption** in your country's data and writing a full interpretation that links it to action.
