

Before you begin

Instance Setup · ~5 min

WHAT YOU NEED IN HAND

- ☐ Your **FASTR Data Prep Checklist** (filled in — *Indicator mapping template sheet*). [Download the blank template](#)
- ☐ Your DHIS2 instance URL (the one your team uses, e.g., <https://hmis.yourcountry.gov>)
- ☐ Your DHIS2 username
- ☐ Your DHIS2 password
- ☐ A browser open on a stable network

What's coming next

You'll work through four handouts in order:

- 1. Import facility structure** — pull your country's admin hierarchy and facility list from DHIS2
- 2. Import and map indicators** — define what to track and link them to DHIS2 indicator names
- 3. Import HMIS data** — pull the actual data values
- 4. Verify and explore** — confirm everything is loaded correctly

About DHIS2 credentials

There is no separate "connect" step. The first time you trigger an import (admin areas, indicators, or HMIS data), the platform shows a small form:

- DHIS2 URL
- DHIS2 Username
- DHIS2 Password
- ☐ Stored connection set up (once per instance)

Tip: the DHIS2 connection is stored **once for the whole instance** — an administrator sets it up on the Data page's **DHIS2 connection** card, encrypted. After that, every import uses it; nobody re-types credentials.

How to use these handouts

Each handout starts with a "Before you start" section listing what should already be done. Read it first — don't skip ahead, the order matters.

What's next

Move on to **Import facility structure**.
