

The FASTR analytics platform

One place to bring together, analyze, and share a country's health data

»» FASTR Useful Data

Where we start

Health data already exists. Every month, facilities enter it into DHIS2. Facility assessments produce more. Household surveys, more still.

The problem isn't a shortage of data. It's that it stays **scattered, hard to reconcile, and slow to turn into analysis.**

Between the moment data is entered and the moment it informs a decision, weeks of manual work often pass.

What if a country's data lived — and worked — in one place?

Brought together, kept current, ready to analyze and share, without starting from scratch every time.

What is FASTR?

An online platform, two roles

FASTR is an online tool. Nothing to install: a browser is enough, and the interface comes in **French, English, and Portuguese**.

It brings together two things usually found in separate tools:

- **A central repository** where a country's health data lives
- **An analysis engine** that processes it automatically, with no code to write

It's this combination that sets FASTR apart from a plain data warehouse.

A simple architecture: the instance and projects

The **instance** is the country's space. It holds the health structure, the indicator definitions, and every data source — once. It is the shared source of truth.

Projects are focused analysis spaces. Each takes a slice of the instance — a period, some regions, some indicators — to answer one specific question.

One shared base, many analyses. Everyone starts from the same data.

It connects to your data sources

Three kinds of source, one platform

| ROUTINE DATA

| HMIS / DHIS2

Facilities' monthly statistics: consultations, vaccinations, deliveries.

DHIS2

| FACILITIES

| Facility surveys (HFA)

The health facility assessment: service availability, equipment, staffing.

HFA

| EQUITY

| Household surveys

Coverage estimates by wealth quintile, drawn from DHS and MICS surveys.

ICEH

Sources that complement each other: the routine, the structural, and the equity view, side by side.

Connecting to DHIS2, without re-keying

FASTR connects directly to DHIS2. You pick the indicators and the period, and the data flows into the platform.

That import can run three ways:

- **Immediately**, on demand
- **At a scheduled time**, for a one-off load
- **On a recurring schedule**, weekly or every two weeks

Once the connection is saved, updates take no further handling. The data stays aligned with DHIS2.

A central repository, a single version of the facts

A country's data stops being scattered across files, machines, and differing versions.

It is imported once, at the instance level, and becomes available to every analysis.

When a correction is made at the source, everyone benefits — not one isolated copy.

One base

shared by every team

One history

tracked over time

One reference

everyone relies on

Not just storage — analysis

The background is a solid teal color. On the right side, there are several overlapping geometric shapes: a large dark teal quarter-circle in the top right, a smaller dark teal quarter-circle in the bottom right, and a series of concentric circles in a lighter teal shade that overlap with these shapes and extend towards the center.

Storing data answers no question. FASTR goes further: it **analyzes**.

Modules process the data automatically — quality, adjustment, service utilization, coverage. Each runs proven methods and produces results ready to visualize.

The user **writes no code**. The results compute in a results package; they attach it and work.

Recognized methods, built into the tool

| What the modules produce

- **Data quality** assessment
- **Adjustment** of incomplete data
- **Service utilization** and disruption analysis
- **Coverage** and denominator estimation

| What makes them reliable

- **Standardized** methods, the same from one country to the next
- **Tracked** versions, so you know which computation produced which result
- **Automatic recomputation** whenever the data changes

The method no longer depends on the person who knows it. It's in the tool.

The powerful part: nothing gets frozen

Analyses stay tied to the data, not frozen in a file.

When the data is updated, the results recompute and the charts follow. No copy-paste to redo, no forgotten figure.

Seeing the results

The background is a solid teal color. On the right side, there are several overlapping geometric shapes. These include two large quarter-circles, one in the top right and one in the bottom right, both in a slightly darker shade of teal. Overlaid on these and extending towards the center are two sets of concentric circles in a very light teal color. The circles are centered near the intersection of the two quarter-circles.

Visualizations suited to each question

| Four forms

- **Charts** to compare across categories
- **Time series** to follow a trend
- **Maps** to see regional gaps
- **Tables** for the exact figures

| That you control

- **Filter** and **disaggregate** by region, facility type, period
- **Customize** the appearance
- **Export** as an image or data for outside use

Form follows the question: "how do our regions compare?" doesn't call for the same chart as "what's the exact number?".

An analysis, not just a chart

Every visualization builds on a module. Here, the **service disruption** analysis compares observed volume to expected volume, across a dozen indicators at once.

The shaded areas flag the gaps. That's a signal to triangulate with the field, not a conclusion on its own.

Sharing — the right format for each audience

The background is a solid teal color. On the right side, there are several overlapping geometric shapes: a large dark teal quarter-circle in the top right, a smaller dark teal quarter-circle in the bottom left, and two sets of concentric circles in a lighter teal shade, one centered near the bottom left and another near the bottom right.

Three ways to share the results

| LIVE

| Dashboards

Several visualizations on one page, always current. Publishable via a public link: partners open them in a browser, with no FASTR account.

| IN THE ROOM

| Presentations

Slide decks assembled in the platform, with title and section pages. Export to PowerPoint or PDF for an in-person talk.

| IN WRITING

| Reports

Narrative documents blending prose and live figures. Export to Word or PDF for a full read.

One dataset feeds all three. You don't redo the work for each format.

The through-line: figures always current

In a FASTR dashboard or report, the charts aren't pasted-in pictures that go stale.

They are **live figures**, tied to the project's data. When the data changes, the document reflects the new reality.

An AI assistant to interpret

A built-in assistant helps read and interpret the results. It understands the project's modules, indicators, and visualizations.

You ask questions in plain language — "what does the ANC1 trend show?", "which regions have the lowest coverage?" — and it answers from the **project's real data**, not guesses.

It also helps draft report text, from a prompt library the team can extend and share.

A tool for teams

The background is a solid teal color. On the right side, there are several overlapping geometric elements: a large dark teal quarter-circle in the top right, a smaller dark teal quarter-circle in the bottom left, and two sets of concentric white circles. One set of circles is centered near the bottom right, and another set is centered near the top right, partially overlapping the dark teal shapes.

Built to work together

Work is organized into projects, and each person gets a fitting role.

Permissions are fine-grained: view, edit, administer. A finished project can be **locked** to preserve its state while staying viewable.

Everyone sees the same data, in the language of their choice.

View

read and export

Edit

create visualizations and reports

Administer

settings and access

End to end, a single flow

Each step follows in the same tool. The data never leaves the platform on its way to a decision.

What this changes

Without FASTR, data is scattered, reworked by hand, and quickly out of date.

With FASTR, it is **brought together** in one place, **analyzed** with recognized methods, and **shared** in the format each audience needs.

A country moves from a collection of files to a shared resource — current and trustworthy — in the service of decisions.

FASTR

From routine data to decisions, without leaving the platform
