

Reading a viz → **Build manually** → Build with AI → Write interpretation → AI interpretation → Spot disruption

Create your first visualization

Activity · Visualizations & Interpretation · ~15 min

BEFORE YOU START

- ☐ You're signed in and looking at your country's project
- ☐ You're in the **Visualizations** tab
- ☐ You have a folder of your own (or you can use the shared one)

What you'll do

Build a simple time-series chart of one health indicator — month by month, over the last twelve months — and save it to a folder. You'll do this manually; the next activity covers the same thing using the AI Assistant.

1 Open a new visualization

In the Visualizations tab, click **+ New visualization**. You'll see a setup panel on the left and an empty chart area on the right.

+ Create visualization

2 Pick what to show

In the setup panel:

- **Indicator:** choose **ANC1** (or any indicator you want to look at)
- **Period:** the last 12 months
- **Chart type:** line chart (best for trends over time)
- **Level:** national, or pick a region if you want to focus

The chart updates as you click.

3 Save it

Click **Save**. Give the chart a clear name — something you'll recognise later: *ANC1 — monthly, last 12 months*. Put it in your folder.

Try it with three different indicators

Repeat the steps with two more indicators of your choice. Pick ones from different programmes (an ANC indicator, an immunisation indicator, a delivery indicator) — you'll get a feel for how each looks.

Tip: A line chart is the right choice for *trends over time*. For comparing places or districts at one point in time, a bar chart usually reads better. The next reference handout (*How to read a FASTR visualization*) goes deeper on this.

Check yourself

You should now have:

- At least one time-series chart saved in your folder
- A clear name on each chart so you can find it later
- A sense of which indicators move smoothly and which jump around

What's next

The next activity does the same thing using the AI Assistant — typing a request in plain language instead of clicking through the setup panel. Same end result, different path.

 **Verify in your current UI:** button labels (+ *New visualization*, *Save*) may differ slightly. The three-step structure — pick indicator + period + chart type → preview → save — stays the same.
